Claude session transcript: MAIIC UI, go-live, production database and fees

This is the record of a Claude Code session that ran from 9 to 15 October 2026 on the MAIIC IFRS 9 system (repository MAICC-IFRS9). It is saved so that another member of staff, with or without an AI tool, can follow what was done, in what order, and why. The conversation was compacted several times; each compaction summary is reproduced where it was written.

It starts at "pull all maic changes and put the db and run any necessary commands" and runs to the saving of this transcript. The work falls into six stages, in time order:

1. 9 October: the changes pulled and the database set up; the user interface reworked (navigation, coloured tabs, the dashboard, the macro statistics, scenario, overlay and forward-looking pages); the pack 3 data.

2. 13 October: the dashboard's ECL build-up and its charts with their own period selectors; the maintenance page and its specification; the forward-looking screens improved; the write-off routes; S&P internal grades; the sidebar, breadcrumbs and the sample files and checks on every import; pack 8 reviewed and pack 9 drafted.

3. 13 to 14 October (overnight): the whole system audited end to end against the specifications and the packs; the results for every period compared with MAIIC's December 2025 model and written up in Downloads; the bootstrap proved reproducible; the documentation audited; everything pushed to master.

4. 14 October: packs 9 and 10 received and landed; pack 10 drafted and its results reviewed; the collateral haircuts from the December 2025 ECL model.

5. 14 to 15 October: the production database backed up to OneDrive and replaced by a fresh bootstrap (98 checks, 0 FAIL), audited against the backup; two install defects fixed (settings, S&P grades).

6. 15 October: what is outstanding; the 324 fee lines in a workbook for Finance; Finance's 2024 and 2025 fee workbooks reconciled to the GL; the fee workbook gate (FeeWorkbookTieOut) built, with the upload files for Finance; Chikwendeni's 800 as a question for Tamanda.

What is included: every user message, every reply shown to the user, every tool call with its input (commands, scripts and file contents) and every tool result. A tool input longer than 24,000 characters or a result longer than 12,000 keeps its beginning and end, with the cut marked; the whole log is kept, redacted, beside this transcript on OneDrive.

What is left out: the assistant's internal reasoning, automatic system reminders, image outputs, and credentials (two Laravel application keys found by redact_session_log.py are replaced by [REDACTED ...]).

How to follow it: the scripts the session ran are in docs/build-files/2026-10-15 in the repository, with a README, and in OneDrive under Query Requests to MAIIC/Build files/2026-10-15. The commits are on master (the last of the session is c343409); another session committed to the same branch over the same days, so the commit messages, not the dates, say which work is whose.

Times are UTC. Source: the session log c9a0f915-2064-4f18-9b98-77857ef71421.jsonl, entries 3 to 16753. Events: 5437.

USER (2026-10-09 07:06:44 UTC)

pull all maic changes and put the db and run any necessary commands

Tool call: Bash

```

EIR Calculator for MAIIC: built as a **module inside the existing `MAICC-IFRS9` Laravel repo** (branch off
`eir_revenue_recognition`), **NOT a separate repo** - decided 2026-09-24. Local clone at `c:\xampp\htdocs\MAICC-IFRS9`. Data at
`OneDrive\2026\Projects\MAIIC\`. Mirrors the IFRS 9 teaching workbook at `Documents\IFRS9_Floating_Rate_EIR_Illustration.xlsx`.

## OPEN QUESTIONS FOR MAIIC (raise at the meeting on/around 24-25 Sep 2026)

1. **The reference-rate refresh button in the loan origination system.** The field arrives pre-populated with a refresh button
beside it, which implies it holds a *stamped snapshot*, not a live link to the PLR file. Evidence: offer letter L01 (Ebenezer
Midian) was approved 8 Aug 2025 carrying a typed rate of 25.10%, but PLR was 25.30% on both the approval and accrual dates -
25.10% had not been in force since early July 2025. **Ask: is the reference rate stamped at record creation, when is it
refreshed, who clicks it, and is refresh mandatory before the offer letter prints?** This decides the `Margin Derivation Basis`
governance default (AS_CAPTURED vs LIVE_AT_DRAWDOWN).
2. **Does file B (actual cash flow transactions) exist and can it be supplied?** Not a blocker any more (the loan book
substitutes), but needed to resolve the ~24% of accounts with counter resets.
3. **Can MAIIC export the original repayment schedules as issued, for the whole book?** Would turn "reproduce the offer letter"
from a 10-loan test into a whole-book control.
4. **Why does `rate_type` in the contract master extract appear inverted?** See findings below. Something downstream may be
reading it backwards.
...
</persisted-output>
```

Tool call: Bash

```
description: Find DB and setup notes in MAIIC memory
--- command ---
grep -n -i -E "database|db_|mysql|migrat|seed|\.sql|dump|port|branch|composer|npm|setup|run " "C:/Users/DELL/.claude/projects/
c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/tool-results/bnkfprrsz.txt" | head -80; ls /c/xampp/
htdocs | grep -i -E "mai|ifrs"
```

Result of Bash

```
11:EIR Calculator for MAIIC: built as a **module inside the existing `MAICC-IFRS9` Laravel repo** (branch off
`eir_revenue_recognition`), **NOT a separate repo** - decided 2026-09-24. Local clone at `c:\xampp\htdocs\MAICC-IFRS9`. Data at
`OneDrive\2026\Projects\MAIIC\`. Mirrors the IFRS 9 teaching workbook at `Documents\IFRS9_Floating_Rate_EIR_Illustration.xlsx`.
17:3. **Can MAIIC export the original repayment schedules as issued, for the whole book?** Would turn "reproduce the offer
letter" from a 10-loan test into a whole-book control.
20:6. **Integration vs CSV** - is direct integration to VGCBS/E-Banker in scope, or CSV import first?
21:7. **How was `Interest Rate Change History.xlsx` generated?** Root cause of its date bug is SOLVED (see findings) - it is an
Excel locale artefact, not a system fault. But confirm: was it a direct database extract by Barry, or did the vendor supply it?
**There is no PLR / interest-rate-change report in E-Banker's documented report catalogue**, so it is almost certainly a raw DB
query. Ask for it re-supplied as **CSV with ISO `yyyy-mm-dd` dates**, and as a repeatable extract rather than a one-off.
22:8. **Ask for three E-Banker reports that are documented but never requested** (`Ebanker MANUAL.pdf` s.5, "MAIIC Report"):
**5.2 Reschedule Report** (restructuring events - needed for modification accounting), **5.1 Audit Trail Report** (who changed
a rate and when - would confirm which accounts are `Interest Policy = Manual`), **5.3 IFRS9 Detail Report** (what E-Banker
already computes for IFRS 9). 5.4 Loan Book Report is the source of the loan books we already have.
34:2. **Three documented E-Banker reports never requested** (`Ebanker MANUAL.pdf` s.5 "MAIIC Report"): **5.2 Reschedule
Report** (restructure events - supports request 12), **5.1 Audit Trail Report** (who changed a rate and when - would identify
the `Manual (M)` accounts; may be the "per account audit report" already referenced in request 12), **5.3 IFRS9 Detail Report**
(what E-Banker already computes for IFRS 9).
35:3. **ISO DATES ON EVERY EXTRACT - and re-supply the ones already affected.** Not just the rate file. A scan of all extracts
on 2026-09-24 found the same Excel locale artefact throughout, with **1,134 business-critical dates silently wrong** (3,974
including `GENERATED_ON` metadata): Extract A `LOAN_START_DATE` 142, `FIRST_REPAYMENT_DATE` 74, `CONTRACTUAL_MATURITY_DATE` 108,
 `ACTUAL_CLOSURE_DATE` 52; **Extract B `TRANSACTION_DATE` 686 of 2,478 rows = 28%**; Interest Rate Change History 20; Dec-2025
EIR assessment 52. Extract C appears clean. Loan books are .xls and were not covered by that scan - still to do. A date is only
genuinely wrong where day != month (e.g. 01/01/2025 survives transposition, 03/04/2023 does not). **Ask: every future extract
as CSV with ISO `yyyy-mm-dd`, generated straight from the database, never opened or re-saved in Excel before sending. And
re-supply Extract A and Extract B on that basis, since the versions we hold cannot be trusted on dates.** Consequence to state:
a wrong LOAN_START_DATE shifts a whole schedule by months; a wrong TRANSACTION_DATE puts cash in the wrong period. Both flow
straight into the EIR and neither looks wrong on the page.
36:4. **E-Banker `IFRS9 Detail Report` (Menu ID 3863)** - manual p.76 text is boilerplate, but the screenshot shows cols 25-36
of a 36+ column report: TENURE/TERMS, INTEREST RATE, **INTEREST COMPOUND (Monthly/semi-annual/annually)**, LOAN SERIES,
INSTALLMENT DATE, INSTALLMENT AMOUNT, FIRST INSTALLMENT DATE, LAST INSTALLMENT DATE/MATURITY, ARREAR DAYS, ARREAR AMOUNT
(P+I+PENALTIES), ARREAR AMOUNT-INTEREST, ARREAR AMOUNT-PRINCIPAL. **Every visible column is an INPUT to IFRS 9, not an output**
- no EIR, no amortised cost, no carrying amount, no stage, no ECL. Does NOT replace the EIR engine, but may be the cheapest
source for compounding frequency, instalment dates/amounts and the arrears split. **Ask for a sample export, the full column
list, and whether MAIIC has ever run it.** No public Virtual Galaxy documentation of an IFRS 9 / EIR capability (web-searched
2026-09-24). Note: **Dr Thom's own Dec-2025 assessment already states E-Banker cannot extract EIR.**
37:5. **CONFIRM GO-LIVE, AND RE-RUN THE LOAN BOOK REPORT FOR THE 14-MONTH GAP.** Say: *"We understand you went live around
October/November 2024 - can you confirm? And can you re-run the Loan Book Report for November 2024 through November 2025? We
have no core banking data for those fourteen months."* **Why it matters, and this is the CFO's point not ours:** Dr Thom has
asked for the effective interest rate to be recalculated from 2024 to 2026. The take-on schedules stop at 31 Oct 2024 and
genuine E-Banker loan books only start Dec 2025. For Nov 2024 - Nov 2025 we currently have only Finance's own Excel workbooks,
which carry no account numbers - so that middle stretch cannot be tied to the core system at all. Without it the 2024-2026
recalculation has a hole in the middle of it. If the report cannot be re-run for past dates, ask what CAN be produced for those
months (EMI chart, transaction spool, or a month-end balance extract).
38:6. **EXTEND THE LOAN BOOK REPORT INSTEAD OF CHASING FIELDS ONE BY ONE - the best ask of the engagement.** Say: *"Rather than
us requesting these one at a time, could Virtual Galaxy add them as columns to the Loan Book Report? It is already a custom
report they built for you - Menu ID 3868, it is in your manual. If the monthly loan book carried these fields, our system could
simply load it every month, and we would stop asking you for anything else."* Full column list and the three tiers are in the
dedicated section below. It is a change request against existing custom work, not a new capability - and it quietly answers the
integration-vs-CSV question, because the monthly file then IS the integration.
41:`Interest Rate Change History.xlsx` (created by Barry 17 Sep 2026 10:42, saved 10:46) has **20 of 48 effective dates with
day and month transposed**. Root cause proven: exported as `dd/mm/yyyy` TEXT, then opened in Excel under an `mm/dd/yyyy` locale
- Excel converted everything valid as mm/dd (day <= 12) and left the rest as text. All 28 text cells have day >= 13; all 20
converted cells have first component <= 12. **Not a core-banking fault.** Also: there is NO PLR/rate-change report in
E-Banker's documented report catalogue, and the column names (`SrNo`, `Appli From Date`, `PLR Rate`, `Active`) are raw DB
columns - so this was a direct query, not a spoolable report. Ask how it was produced and whether it can be made repeatable.
48:- **CLARIFY: what is the actual E-Banker go-live date?** Ask it plainly and get a date, not a year. Also ask: (a) was there
a parallel-run period where Finance kept their own Excel loan book alongside E-Banker, and if so until when? (b) was the whole
book migrated at once on 31 Oct 2024, or in waves? (c) were any facilities originated AFTER go-live still recorded in the Excel
workbooks? The answer sets the boundary between take-on data and core-banking data for every legacy loan, and therefore where
each loan's EIR history starts. Supporting evidence for the question is the structural finding below.
49:- **E-Banker go-live - RESOLVED from loan book structure 2026-09-24.** The earlier claim that eBanker loan books exist from
Jan 2024 was WRONG. The `Maicc <Month> 2024/2025.csv` files are Finance's own Excel ECL workbooks, not core-banking output:
17-19 cols, serial `customer_id` 1,2,3..., plus `contract_id`, `industry_code`, `internal_grade`, `carrying_amount` and ageing
buckets - same lineage as the take-on schedules. **No account numbers at all.** `Loan Book as at 30 November 2025.xlsx` is not
a loan book either - it is a GL file (GL Code / GL Title / Liabilities / Assets, 694 rows). **Genuine E-Banker Loan Book Report
output (Menu ID 3868) starts only at December 2025**: 29 cols, 15-digit A/C numbers, National ID, `Loan Type :` headers.
Take-on cut is 31 Oct 2024 but we hold NO core-banking loan book for Nov 2024 - Nov 2025 (14 months). Confirm go-live and ask
for the Loan Book Report re-run for those months.
55:A corrected, import-ready version exists: **`plr_reference_rates_corrected.csv`** (48 rows, ISO dates, 20 dates repaired, 28
untouched, 26 genuine rate changes, 2020-03-04 to 2026-09-03, chronological order validated) plus
**`plr_dates_for_barry_to_confirm.csv`** listing only the 20 rows we changed, showing what the file said and how we read it.
Built 2026-09-24 in the session scratchpad; regenerate from `Interest Rate Change History.xlsx` with the day/month swap on
datetime cells. The repair is an inference (0 ordering breaks after swap vs 11 before) and **must still be confirmed by Barry
against the source table** - hand him the 20-row list, not the whole file.
59:- **Can it be made repeatable?** There is no rate-change report in E-Banker's documented catalogue, so today it is a one-off
query.
60:- **Going forward, integration or CSV

[... 17,934 characters cut here; the full text is in the session log kept with this transcript ...]

lly:** run monthly from Oct 2024 it gives interest recognised per account for Nov 2024 - Nov 2025 even if the Loan Book Report
cannot be re-run for past dates.
362:- **It IS per loan account.** Confirmed from the p.76 screenshot: columns are `Sr. No. | A/C Number | Account Name |
Applicable From Date | Applicable Upto Date | Total Interest Product | Interest Amount | Transfer to A/C Number | Interest
Posted By | TDS Deducted | PAN`, and every row carries a 15-digit account number WITH the sub-account suffix (e.g.
`000104420000006-1`). So it posts by loan account + sub-account, not by GL total - which is exactly why Extract C could be
built from it. Put this on the standard-reports slide: *"this report gives interest per loan account per month, with the
sub-account, so it is our per-loan reconciliation source"*.
```

```
363:- **Ask:** its Menu ID; who runs it; a monthly run for all GL codes from Oct 2024 to date, exported to Excel not PDF.
365:**Deck slide required - "The extracts explained" (added 2026-09-24):** one slide, before the standard-reports section,
explaining for a non-technical reader what Extract A, B and C each are, what they attempted to do, how the client most likely
ran them, and whether their columns marry the manual:
367:- **Extract B** = the TRANSACTION LEDGER for 2025: every posting to every loan (disbursement, interest, principal+interest,
fee) plus projected instalments. Most likely a query over the transaction table behind Transaction Posting (sections 7.1-7.2,
pp.58-60) and the Batch Detail Report (553). `GL_POSTING_REF` = GL code + posting number marries the manual's posting model;
but it lacks the DR/CR indicator the posting screen has (p.58), and the "Scheduled" rows are a projection with no balance, not
stored data.
368:- **Extract C** = INTEREST POSTED per loan account per month, Jan 2025 - Jul 2026, netted over TRANTYPE 303/120/308/309/310/
311. This is the GL-wise Interest Posted Report (the p.76 figure) aggregated to months - its columns marry that report exactly
(account + sub-account, GL code, amount, posting references).
376:- Users: **MAIIC finance team**. Deployment: **into MAIIC's own environment**. Reporting: **month-end only**.
379:- Import is **four files**: A contract master (with margin), B transactions (optional), C PLR series, D schedules as issued
(optional).

98df959 M16: screens for the finder and the pack, macro permissions, help chapters renamed (audit finding M16)
de2ea11 M6: the legacy regression chain retired behind the reports permission (audit finding M6)
e5dc5d5 M10: the PD on the measured stage, and exits that are not all "Paid" (audit finding M10)
0ca0bdd M11: a governed cure period for staging (audit finding M11)
6091b93 Feed zip: every entry name checked before extraction, at the API door, the upload screen and the poller (audit M14)
22066b3 Gates at the door and the trial balances through it (audit M2, M1)
dde22a7 Wire fli_expected_sign_test and macro_source_precedence; the FLI bridge is the one writer of governed_parameters (audit
M12)
84a286a The manual-overlay register, the overlay tie on the lock, the scenario-set editor (audit M3, M4, M5)
58bee69 EIR as at a date: the section-3 part month, months rolled at the monthly EIR, the take-on opening, Excel and PDF
downloads (audit M13)
07edaa2 Take-on recompute from origination: workbook schedule as version 1, EIR solved, amortised cost rolled to the take-on
(audit M7)
afb0efe Audit closures recorded; After Build Report figures restated on the IFRS 9 basis
af95179 Tranches in the EIR vector; a short-window PD annualised; reports and stress by the measured stage; gross carrying in
the note (audit H2, H8, H5, H6)
4a31816 The lock is honoured by every engine; thresholds as at the period end with no silent default; the administrator
override is governed (audit H4, H11, H9)
9cf408c FLI route test schema carries the columns the sensitivity reads
d062a53 The bootstrap approves no fit and reviews no fee; one scenario weighting; the sensitivity reconciles to the allowance
(audit C9, H3, M8, M9)
bf616a7 Write-offs and settlements in kind leave the gross without being cash (audit H1, M15)
7d339a6 Stage 3 interest nets the allowance the engine wrote; schedule cash only outside the feed; ECL for every month (audit
C5, C6, M17)
ba117ff ECL on the IFRS 9 basis by stage: lifetime PD for Stage 2, one tenor unit, Stage 3 at the reporting date, discounted
LGD (audit C1, C2, C3, H7, M3)
d58a8b0 Every web route needs a login; legacy modules need their suite permission (audit C7, C8)
4a98dca Governance defaults in force from inception (audit finding H10)
e176d1d System audit of 9 October 2026; the test suite runs whole
f5b08fc RBM bands corrected to the Gazette; compliance PDF footer names MAIIC
f324814 Dark-mode page sweep (spec 11.9): every page follows the theme, proven by capture
742e7a7 RBM Classification report classifies by the directive's bands by term (workbook 4 finding F3 closed)
8993a14 RBM return (provisional): the directive s.17 classification and provisioning return filled from the system
ea48d0d The Mega Farm screen; the method cards inline on the Governance Centre setting (spec v4 s.16, 14.7)
a2f8b98 The chain in its final order from one command; the reports in their own process; the after-build report for the third
round
a86e88b The audit trace per contract; the View-as-at picker on the contract's schedule page (spec v4 s.12.5, 6.11)
b2c04b0 Help centre re-worded for the suite layout; a navigation article; the seeders refresh the shipped text (spec v4 s.11.6)
4474701 The Mega Farm programme in the ECL module, ready for D30 (spec v4 s.16)
2c287dd Feed routes 2 and 3: the polled folder and the API push, through the same door (spec v4 s.6.5)
87a0a42 Macro Statistics: the five-tab screen, the IMF WEO parser, the RBM policy-rate file, preview then commit, the
precedence rule (spec v4 s.13)
fbf1e3c The compliance register, the auditor's pack and the three remaining workbooks (spec v4 s.12, CA-3 and CA-4)
99b4161 Stress testing and the reports in the chain (spec v4 s.6.10.1 steps 11 and 12)
aa2b991 The forward-looking route: a fit approved under maker-checker, run once per scenario, the lineage on every loan (spec
v4 s.14.6 to 14.8, 15.5)
6e516ee PD and LGD engine tests on a four-loan fixture; the lifetime PD computed in PHP
4693534 After-build report and the impairment workbook updated for the second round: the chain complete to the ECL
09ac5da The PD and LGD engines as services; the chain produces an ECL on the clean install (spec v4 s.6.10.1 steps 4, 5, 7)
40ba02b Compliance audit workbooks: the engine ported with the two MAIIC columns and the Baselines sheet; the IFRS 9 EIR and
impairment modules (spec v4 s.12, CA-1, CA-2, part of CA-4)
c6353ff Scenario sets as governed objects: rules, shocks on the base, approval, lock, versions, back-test, sensitivity (spec v4
s.15, SC-1 to SC-4)
22797db The forward-looking chain runs on MAIIC's data: guardrail, structural events, proxies, profiler, correlation finder,
regression (spec v4 s.14.3 to 14.6)
c5a2ef3 Session transcript of the 8 October 2026 build
40b5beb After-build report of 8 October 2026 against spec v4; installation guide 9.8 rewritten for the bootstrap
faf0b63 Test folder case: tests/Feature/FLI
a26ccec The transmission methods, each explained with its preconditions checked live (spec v4 s.14.7)
0c4d748 Macro statistics from the World Bank with provenance and an offline snapshot (spec v4 s.13, MS-1 to MS-3)
c84898f The Dupleix-suite layout with light and dark mode; the feed, take-on and as-at screens (spec v4 s.11, 6.8, 6.9, 6.11;
D24)
9f175fb The EIR as at any date (spec v4 s.6.11); the ledger's cash movements feed the roll-forward (s.7.1)
c6ab48a Bootstrap: stage before the revenue roll-forward, which reads the stage
14db1d5 eir:bootstrap: a clean install that loads itself and proves itself (spec v4 s.6.10, D26)
f38a246 Take-on schedules landed, not typed; the take-on population built under its basis (spec v4 s.6.9)
61049f4 Stage a built period under the directive thresholds and the missed-instalment trigger (spec v4 s.3.6, D31)
76

commit de6923fed01de42b5e96e7df51e278b22945ca9c
Author: Wadza2 <wadzanairombe@gmail.com>
Date:   Fri Oct 9 09:01:37 2026 +0200

    Example env files for the bootstrap and demo databases (secrets blank)

    Colleagues restoring the shared dumps from OneDrive copy these to .env.bootstrap / .env.demo (both git-ignored) and fill
APP_KEY (key:generate), the database password and the screenshot credentials.

    Co-Authored-By: Claude Fable 5.1 <noreply@anthropic.com>

docs/After_Build_Report_2026-10-08.md:145:`.env.bootstrap` names the throwaway database and is git-ignored, like `.env.demo`;
the cache prefix is keyed by `APP_ENV` so the three databases never share a permission cache. The test run above: 308 passed,
24 skipped. The dark-mode proof: serve the bootstrap database locally, then `php artisan --env=bootstrap manual:screenshots
--base-url=http://127.0.0.1:8010 --theme=dark --out=<folder>` (the capture user's saved theme governs after login, so set it to
dark for the run). The 92 legacy medical tests and the five legacy FLI page tests fail on `master` before this work and are
unrelated.
docs/After_Build_Report_Demo_2026-10-08.md:9:| Copy | `maiic_ifrs9` dumped and restored as `maiic_ifrs9_demo`; `.env.demo`
points at it; pending migrations applied | 161 tables; source untouched |

CLAUDE (2026-10-09 07:08:22 UTC)

Both dumps (bootstrap and demo, 9 Oct) are in OneDrive; neither database exists locally yet, so restoring them overwrites nothing. Restoring now.

Tool call: Bash

```
description: Create and restore bootstrap and demo databases
--- command ---
D="/c/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project Execution/Database"; M="C:/xampp/mysql/bin/mysql.exe"; for n in
bootstrap demo; do "$M" -uroot -e "CREATE DATABASE maiic_ifrs9_$n CHARACTER SET utf8mb4 COLLATE utf8mb4_unicode_ci;" && gzip
-dc "$D/maiic_ifrs9_${n}_2026-10-09.sql.gz" | "$M" -uroot --max_allowed_packet=512M maiic_ifrs9_$n && echo "$n restored"; done;
"$M" -uroot -N -e "SELECT table_schema, COUNT(*) FROM information_schema.tables WHERE table_schema LIKE 'maiic%' GROUP BY
table_schema;"
{
 "timeout": 600000
}
```

Result of Bash

```
bootstrap restored
demo restored
maiic_ifrs9    161
maiic_ifrs9_bootstrap    178
maiic_ifrs9_demo    188
```

CLAUDE (2026-10-09 07:08:55 UTC)

Both restored (178 and 188 tables). Now creating the env files and checking migrations.

Tool call: Bash

```
description: Show blank keys in env example and gitignore entries
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -E "=$" .env.bootstrap.example | head -20; grep -n -E "^\.env" .gitignore
```

/**
 * System audit of 9 October 2026, finding H10. The seeded governance defaults
 * were effective from 1 January 2025 (the first loan-book month), but the
 * schedule generator and the EIR resolve a setting as at the contract's
 * origination date, and 63 of MAIIC's 144 contracts predate 2024: sixteen
 * were refused for "no approved value is in force for day_count". The seeder
 * now dates defaults from inception; this backdates the defaults an installed
 * database already holds. Only the seeder's own untouched rows move: the
 * seeder's reason, no proposer, no approver, effective 2025-01-01. A value a
 * MAIIC person proposed or approved is never touched, and a key that already
 * has a row at the inception date is left alone.
 */

CLAUDE (2026-10-09 07:09:29 UTC)

All drops are only in the rollback paths, so the up migrations are additive. Backing up `maiic_ifrs9` first, then migrating demo and main.

Tool call: Bash

```
description: Back up main DB, then migrate demo and main
--- command ---
B="/c/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project Execution/Database Backups/maiic_ifrs9_pre-migrate_2026-10-09.sql.gz";
"C:/xampp/mysql/bin/mysqldump.exe" -uroot --single-transaction --routines --triggers maiic_ifrs9 | gzip > "$B" && ls -la "$B"
&& cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan migrate --env=demo --force 2>&1 | tail -6 && php artisan migrate --force 2>&1 |
 tail -18
{
 "timeout": 600000
}
```

Result of Bash

```

## 11. Upgrades and Deployment

Schedule 2 offers two deployment methods. Git-based deployment is recommended because fixes during UAT and warranty reach the
server in minutes.

### 11.1 Git-based deployment

`.github/workflows/deploy.yml` runs on every push to `master` after the CI tests pass. It connects to the server over SSH and
runs:

```bash
cd $DEPLOY_PATH && git fetch origin master && git checkout master && git pull --ff-only origin master && bash scripts/deploy.sh
```

Configure these GitHub environment secrets for the `production` environment: `DEPLOY_HOST`, `DEPLOY_PORT`, `DEPLOY_USER`,
`DEPLOY_PATH`, `DEPLOY_SSH_KEY` (a private key whose public half is in the service user's `authorized_keys`) and
`DEPLOY_KNOWN_HOSTS` (the server's host key line). Optionally set `HEALTHCHECK_URL` on the server so the script verifies the
site after bringing it up.

`scripts/deploy.sh` then: takes a lock so two deployments cannot overlap; enables maintenance mode; runs `composer install
--no-dev --optimize-autoloader`; runs `npm ci` and `npm run build`; runs `php artisan migrate --force`; rebuilds the config,
route, view and event caches; restarts the queue workers; disables maintenance mode; and, if a health check URL is set,
requests it and fails the deployment when it does not return success. If any step fails the script brings the site back up and
exits non-zero, which the workflow reports.

11.2 Manual deployment

On the server, as the service user:

```bash
cd /var/www/maiic-ifrs9
git fetch origin master && git checkout master && git pull --ff-only origin master
bash scripts/deploy.sh
```

or, step by step, the same commands the script runs. Always take a database backup (chapter 10.2) before a release that
contains migrations.

11.3 Rollback

Code: check out the previous tag or commit and rerun the deployment script.

```bash
git log --oneline -5
git checkout <previous-commit>
bash scripts/deploy.sh
```

Database: migrations in this project are additive; a code rollback rarely needs a schema rollback. If it does, restore the
pre-release backup (chapter 10.3) rather than running `migrate:rollback` on production data.

11.4 Release discipline

- Production tracks `master` only. Feature branches merge through pull requests after CI.
- Each release note lists the tickets delivered (the Support Tickets module holds the client-facing record).
- Changes to scope, timeline or fees follow the change request form in Schedule 6 of the agreement (clause 13).
- Post-warranty support is charged per hour under Schedule 8 unless a support arrangement is agreed; response targets are one
business day for critical, two for high and five for medium and general issues.

11.5 Upgrading platform dependencies

PHP minor versions and Composer packages are updated by Dupleix on a branch, tested in CI, and deployed like any release. A PHP
major version change (for example 8.2 to 8.4) is planned as a change with a test deployment first.
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 07:09:53 UTC)

Assets changed (30 files), no dependency changes. Running the project's deploy steps locally: composer install, npm build, the safe help/permissions seeders, cache clear.

Tool call: Bash

```
description: Install deps, build assets, run safe seeders, clear caches
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && composer install --no-interaction 2>&1 | tail -3 && npm run build 2>&1 | tail -4 && for s in
HelpContentSeeder HelpAdminContentSeeder MaiicAdminPermissionsSeeder; do php artisan db:seed --class=$s --force 2>&1 | tail -1;
done && php artisan optimize:clear 2>&1 | tail -2
{
 "timeout": 600000
}
```

Result of Bash

```
[32m117 packages you are using are looking for funding.[39m
[32mUse the `composer fund` command to find out more![39m

Code: `MAICC-IFRS9` (branch `eir_revenue_recognition`) fast-forwarded by 76 commits to `de6923f`. That covers the 9 Oct system audit fixes, step 8, the Mega Farm screen and the Pack 3 queries to Barry. Nothing conflicted.

Databases: I restored the two shared dumps from `OneDrive\2026\Projects\MAIIC\3. Project Execution\Database\`. Neither database existed on this machine before, so nothing was overwritten.

```
| Database | Tables | Migrations |
|---|---|---|
| `maiic_ifrs9_bootstrap` (new) | 178 | already up to date |
| `maiic_ifrs9_demo` (new) | 188 | 4 pending, now run |
| `maiic_ifrs9` (your existing one) | 161 → more | 16 pending, now run |
```

I backed up `maiic_ifrs9` before migrating it, to `Database Backups\maiic_ifrs9_pre-migrate_2026-10-09.sql.gz`. I checked the migrations first: they only add things, and the drops are all in the rollback code.

Other commands I ran:

- Created `.env.bootstrap` and `.env.demo` from the new example files and generated a key for each. Git ignores both files.
- `composer install` and `npm run build`. The front end changed in 30 files.
- Refreshed the help centre text (31 user articles and 28 admin articles) and re-ran the admin permissions seeder.
- Cleared the caches.

Every database now shows 0 pending migrations and the app loads its 626 routes. To run against the demo database, use `php artisan serve --env=demo --port=8010`.

Two things to know:

1. **The new example env files crash artisan as written.** They set `BROADCAST_DRIVER=pusher` but leave the Pusher keys blank, so every artisan command fails with a TypeError. I switched it to `log` in my local copies only. Anyone else restoring the dumps will hit the same error, so the two example files should be fixed in the repo too. I haven't committed anything.
2. **I didn't re-run the governance seeders on `maiic_ifrs9`.** These are `GovernanceSettingsSeeder` and `StagingThresholdSeeder`, which carries the RBM bands corrected to the Gazette. They change governed, maker-checker values, so they need your go-ahead. The bootstrap and demo dumps already include them.

USER (2026-10-09 07:15:01 UTC)

so is everything done done

CLAUDE (2026-10-09 07:15:07 UTC)

Nearly. The pull, both restores and all the migrations are finished. Two things are still open:

1. **Your main `maiic_ifrs9` database is behind on governance settings.** It has 28 governance rows, while the fresh bootstrap has 50. The seeders that would add the missing rows are `GovernanceSettingsSeeder` and `StagingThresholdSeeder`, which includes the RBM bands corrected to the Gazette. I haven't run them because they change governed, maker-checker values. Until they run, the engines on that database may refuse contracts with "no approved value is in force". The bootstrap and demo databases already have them, so they're unaffected.
2. **The two example env files in the repo are broken.** `.env.bootstrap.example` and `.env.demo.example` set `BROADCAST_DRIVER=pusher` with blank keys, so anyone else restoring the dumps will get a crash. It's a one-line fix in each file, but I haven't committed it.

If you're only using the bootstrap or demo database, you're done. If you also want `maiic_ifrs9` current, say yes and I'll run the two seeders (a backup from today already exists) and commit the env example fix.

USER (2026-10-09 07:15:59 UTC)

yes

Tool call: Bash

```
description: Check the two seeders are safe to re-run
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -E "updateOrInsert|updateOrCreate|firstOrCreate|insertOrIgnore|->insert\(|->update\(|

CLAUDE (2026-10-09 07:16:19 UTC)

Both seeders only add what's missing (the governance one skips keys that already exist), so they're safe to run. Running them now.

Tool call: Bash

```
description: Run governance and staging seeders on main DB
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && for s in GovernanceSettingsSeeder StagingThresholdSeeder; do php artisan db:seed --class=$s
--force 2>&1 | tail -2; done; "C:/xampp/mysql/bin/mysql.exe" -uroot -N maiic_ifrs9 -e "SELECT 'staging',COUNT(*) FROM
staging_thresholds UNION ALL SELECT 'gov',COUNT(*) FROM governance_settings UNION ALL SELECT 'gov_inception',COUNT(*) FROM
governance_settings WHERE effective_from < '2025-01-01';"
```

Result of Bash

```
[32mGovernance settings: 23 default(s) seeded, 27 already present.[39m

[32mStaging thresholds seeded: short-term 31/91, medium and long-term 31/181, Mega Farm 31/91, long-term Stage 2 proposal
inactive.[39m

CLAUDE (2026-10-09 07:17:04 UTC)

Yes, everything's finished now.

- **Main `maiic_ifrs9` database:** the governance seeder added the 23 missing defaults, so there are now 51, all in force from inception. That means older contracts won't be refused for a missing setting any more. The staging seeder added the 4 Gazette thresholds: 31/91 days for short-term, 31/181 for medium and long-term, 31/91 for Mega Farm, plus the long-term proposal, which stays inactive until the CFO signs it off. Neither seeder overwrote an existing value.
- **Env example fix:** both example files now set broadcasting to `log`. I committed this as `2efc597` and pushed it to `eir_revenue_recognition` only. I left `master` alone because a push there would trigger a deploy.

To recap the whole job: all 76 commits are pulled; the bootstrap and demo databases are restored; all three databases are migrated and seeded; dependencies are installed, assets rebuilt and caches cleared. The backup taken before migrating is in `Database Backups\maiic_ifrs9_pre-migrate_2026-10-09.sql.gz`.

USER (2026-10-09 07:21:16 UTC)

# After-build report: the demo build of 8 October 2026, against specification v4

**What this is.** On the evening of 8 October 2026 the E-Banker data of 7 and 8 October was loaded into a copy of the
MAICC-IFRS9 database (`maiic_ifrs9_demo`, run with `php artisan --env=demo`) and taken as far through the existing engines as
the system allows, for the meeting with Dr Thom on 9 Oct

## 1. What stands on the demo database

| Step | What was done | Result |
|---|---|---|
| Copy | `maiic_ifrs9` dumped and restored as `maiic_ifrs9_demo`; `.env.demo` points at it; pending migrations applied | 161
tables; source untouched |
| Governance | `GovernanceSettingsSeeder` | 28 settings in force from 1 January 2025 |
| Loan books | The stored Loan Book Report runs (`P2_08`), latest run per account-month, mapped onto `loan_books` by a loader
script (spec v4 method A) | 2,361 rows, 21 month-ends Dec 2024 to Aug 2026, carrying totals equal to the figures tied to the
ledger on 7 October (Dec 2025: 14,841,212,780; Au
| Trial balances | `eir:import-trial-balances` on the 20 monthly files and the AFS bridge | 21 files, 3,803 lines, 0 rejected |
| Schemes | DD_10 scheme settings loaded into `schemes` | 18 schemes: interest policy, floating flag, balance-wise interest,
EMI type |
| Contract master | A file built from the account and loan masters with the headers the importer accepts, loaded through
`MappedFileReader` and `ContractMasterImportService` | 144 contracts created; 40 held because no loan-book row exists for them
since Dec 2024 (closed earlier); 36 floating by Inte
| Reference rates | `eir:import-reference-rates` on the corrected PLR series | 48 rows, 26 changes, current 21.20% |
| Spreads | `eir:derive-spreads` | Derived; drift flagged where the spread moved more than 0.15 points |
| Schedules | `eir:generate-schedules` | 31 drafts generated; 113 refused with named reasons; 31 approved under the label
"System Bootstrap (automated data-readiness, not a MAIIC approval)" |
| EIR | `EirCalculationService::calculate` on the 31; locked with the administrator override under the same label | 31 solved:
FInES 10.47% effective annual; MAIIC Agricultural 32.9%; MAIIC Industrial 31.4%; term loans 40.9% (nominal 35% compounded
monthly) |
| Staging | `StagingClassifier` on the loaded rows, fed the five arrears buckets of the stored report under the tape's own
header names, with days past due counted from `OVERDUE_PRINCI_DATE` (the RBM DFI directive of 2018, spec v4 3.6, seeded by
`StagingThresholdSeeder` by tenor class: Stage 2 from
| Revenue | `eir:run-revenue` for 2025-12 and 2026-08 | 28 and 31 contracts; cash taken from the schedule (no actual
transactions loaded); August 2026 EIR interest 275.8 m on an opening gross of 11.44 bn for the 31 |

c84898f The Dupleix-suite layout with light and dark mode; the feed, take-on and as-at screens (spec v4 s.11, 6.8, 6.9, 6.11;
D24)
config/menu.php regrouped into the six working groups, each with its
accent, plus System Documentation and Administration; the tree carries a
one-line description per screen and is the single source of truth. The
sidebar renders the group colours and folds to a 68px icon rail (remembered
in the browser; a drawer on a phone). The top bar carries the menu toggle,
the financial-period chip, the appearance switch (light, dark, follow the
device), the bell and the user menu; the decorative search box and the
dead consultation-channel code are gone. Every page opens with a header:
icon tile in the group colour, breadcrumb derived from the tree and the
route, title, description, actions slot. Tailwind runs in class mode; a
four-line script sets the theme before paint; useTheme keeps the switch,
the profile and the server (users.theme_preference, profile.theme) in
step; the shared classes carry their dark variant in app.css.

Three new screens: Data Foundation / E-Banker Feed (route in force, method
in force, loads with gate results and accepted exceptions, watermarks,
land a pack by route 1, propose and approve a build, periods built, the
query register, the queries as a file); Data Foundation / Take-on
Schedules (the workbook, every block with mapping, confidence, tick, fees,
gates and cells, confirm a mapping or enter fees on the screen with the
audit log, the take-on population and its basis); Report Hub / EIR as at
a Date (the book by product and GL with the revenue shift, one contract's
full computation, the year-end shortcuts, the CSV). NavigationTest proves
every leaf names a registered route and every group has an accent.

CLAUDE (2026-10-09 07:22:15 UTC)

Your colleague's dashboard was in the pull, and it's already built and running. It's commit `c84898f`, "the Dupleix-suite layout with light and dark mode", which is the same design as the TNM system:

- The sidebar is grouped into the six working areas, each with its own colour, and folds down to an icon strip.
- The top bar has the financial-period chip, a light/dark switch, the bell and the user menu.
- Every page opens with a header showing an icon, breadcrumb, title and description.
- It uses MAIIC's colours from `tailwind.config.js`: the green from the login screen as the main colour and a gold as the second colour, where TNM uses its own green and amber.

It also added three new screens: E-Banker Feed, Take-on Schedules and EIR as at a Date. The front end was rebuilt after the pull, so all of this is already live.

For the meeting, open http://127.0.0.1:8010. That copy is running on `maiic_ifrs9_demo`, your colleague's database. The only user in it is `admin@localhost.com`. I don't have its password because it came in their dump, so get it from them if you don't already know it.

Two things to know:

- Keep that server running during the meeting. If it stops, restart it with `php artisan serve --env=demo --port=8010` in the MAICC-IFRS9 folder.
- Don't use port 8020 or the plain `php artisan serve` for the demo. Those use your own local `maiic_ifrs9` database, not your colleague's.

USER (2026-10-09 07:23:13 UTC)

I said I need the dahbord to look lile Tnm mpama can u do that

CLAUDE (2026-10-09 07:23:17 UTC)

Yes. First I'll look at the TNM Mpamba dashboard and the current MAIIC one side by side.

Tool call: Bash

```
description: Locate TNM dashboard files and route
--- command ---
cd /c/xampp/htdocs/TNMMpamba && git branch --show-current; git status --short | head -5; ls resources; find resources -iname
"*dashboard*" | grep -v node_modules | head -20; grep -n -i "dashboard" routes/web.php | head -10
```

Tool call: Bash

```
description: Locate MAIIC dashboard page and controller
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && wc -l resources/js/Pages/Dashboard.vue; grep -n -i "dashboard" routes/web.php | head -5; grep
-rn "Inertia::render('Dashboard'" app | head -3
```

Result of Bash

```

CLAUDE (2026-10-09 07:23:22 UTC)

Both systems come from the same platform, which makes this easier. Comparing the two dashboards.

Tool call: Bash

```
description: Size up TNM dashboard components and history
--- command ---
cd /c/xampp/htdocs/TNMMpamba && wc -l resources/js/Pages/Dashboard.vue resources/js/Pages/Dashboard/*; git log --format="%h %ad

CLAUDE (2026-10-09 07:23:50 UTC)

I'll port the TNM layout onto MAIIC, keeping MAIIC's own figures, its portfolio filter and dark mode. First, checking what the demo data and routes support.

Tool call: Bash

```
description: Inspect demo ECL data and table columns
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && M="C:/xampp/mysql/bin/mysql.exe"; "$M" -uroot maiic_ifrs9_demo -e "SELECT period,
ecl_calculated, pd_id, lgd_id FROM reporting_periods WHERE ecl_calculated=1 ORDER BY period DESC LIMIT 5; SELECT
reporting_period, ifrs9_stage, COUNT(*), SUM(total_ead), SUM(total_ecl) FROM expected_credit_loss GROUP BY 1,2 ORDER BY 1 DESC
LIMIT 9; SHOW COLUMNS FROM reporting_periods; SHOW TABLES LIKE 'imports';" 2>&1 | head -60; "$M" -uroot maiic_ifrs9_demo -N -e
"SHOW COLUMNS FROM expected_credit_loss" | awk '{print $1}' | paste -sd' '
```

Result of Bash

```
period	ecl_calculated	pd_id	lgd_id
2023-12-01	1	4	2
reporting_period	ifrs9_stage	COUNT(*)	SUM(total_ead)	SUM(total_ecl)

CLAUDE (2026-10-09 07:24:17 UTC)

MAIIC already has matching style classes (`maiic-panel`, `maiic-table`, `maiic-badge`, `maiic-kpi`), so the port maps cleanly. Reading them plus the colour palette.

Tool call: Bash

```
description: Read MAIIC component CSS, palette and layout header slot
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -n 40,200p resources/css/app.css; sed -n 15,60p tailwind.config.js; grep -n -E "#header|
slot name=\"header\"|pageHeader|PageHeader" resources/js/Layouts/AppLayout.vue | head
```

Result of Bash

```
    display: none !important;
}

    /* ------------------------------------------------------------------
       The page sweep (spec v4 section 11.9). Some 230 of the 292 pages
       predate the suite shell and colour their elements directly with the
       light utilities. Rather than touch each in turn, the light utilities
       are re-mapped here under .dark to the suite's dark palette, so every
       page follows the theme at once. A page that carries its own dark:
       variant keeps it: Tailwind emits the dark: utilities after this
       layer, and at equal specificity the later rule wins. The map is
       keyed to the utilities the pages actually use (counted 9 October
       2026): surfaces, text, borders, dividers, rings, hover and focus
       states, the pastel tints with the text they pair with, shadows.

commit -q -F - <<'EOF'
Dashboard in the TNM Mpamba layout, in the MAIIC palette

Stage cards carry coverage, LGD applied and the loan count; the trend stacks ECL by stage under the coverage line, with an EAD
and ECL table behind it; the summary adds the number of loans, the Stage 3 share and coverage; an operations row shows the
month-end status, the latest loan book by stage and the recent imports. The portfolio filter, the help button and dark mode are
kept. The trend defaults to the 12 months up to the reporting period. No existing figure changes how it is computed.

CLAUDE (2026-10-09 07:36:01 UTC)

The MAIIC dashboard now uses the TNM Mpamba layout in MAIIC's green and gold. Refresh http://127.0.0.1:8010 to see it. I checked it with screenshots in both light and dark mode.

What it now has, as on TNM:

- Six headline figures, with a change indicator against the comparison month.
- Stage 1/2/3 cards that now include coverage, the LGD applied and the loan count.
- An exposure-by-stage doughnut, and a trend chart showing ECL bars by stage with the coverage line over them. Each has a Chart/Table switch.
- A fuller portfolio summary, adding the number of loans, the Stage 3 share and coverage.
- A new bottom row: **month-end status**, **latest loan book** and **recent imports**.

MAIIC's portfolio filter, help button and dark mode are kept, and no figure is calculated differently. The change is committed locally as `72f907d` but not pushed, so your colleague won't get it until you say push.

Three things will look wrong in front of Dr Thom, and none of them is the layout:

1. **The ECL figures are from Dec 2023.** The demo database only has ECL for that month, and there's no Dec 2023 loan book behind it. So the top half shows ECL of 384m against an EAD of 0 and 0% coverage. The real current position (Aug 2026: 135 loans, 23.3bn, split 62/23/50 by stage) is only in the "Latest loan book" panel. Fixing the top half means running ECL on the 2026 books, which is an engine run.
2. **Everything is labelled USD, not MWK.** The demo database's currency setting is USD and it has no MWK currency set up at all.
3. **The demo copy is slow.** The login page took about 20 seconds through the single-threaded test server. Open it and click through once before the meeting starts.

I can run ECL for Aug 2026 on the demo copy and add MWK as the currency now if you'd like.

USER (2026-10-09 07:39:58 UTC)

wc database are we using here because it seems empty , there is also an oion next to where it says ifrs9 ecl what happend to it , its not showing clearly8;o

CLAUDE (2026-10-09 07:40:06 UTC)

You're on port **8050**, but the server I started is on **8010**. Checking which database 8050 is using, and looking at that icon.

Tool call: PowerShell

```
description: Identify the process serving port 8050
--- command ---
$c = Get-NetTCPConnection -LocalPort 8050 -State Listen -ErrorAction SilentlyContinue | Select-Object -First 1; if ($c) { $p =
Get-CimInstance Win32_Process -Filter "ProcessId=$($c.OwningProcess)"; $p.CommandLine; $pp = Get-CimInstance Win32_Process
-Filter "ProcessId=$($p.ParentProcessId)"; $pp.CommandLine } else { "nothing on 8050" }
```

Tool call: Bash

```
description: Find header tile colour logic in layout
--- command ---

Tailwind scans resources/js/**/*.js, so the group colours in navAccents.js are built

The page header tile and the sidebar group tiles take their classes from navAccents.js, which the content globs did not cover;
slate, teal, violet, rose and sky were purged, leaving the Dashboard header tile as a white icon on a white page.

CLAUDE (2026-10-09 07:41:26 UTC)

The icon is fixed and committed (`5cb5151`). Press **Ctrl+F5** to see it. The sidebar groups will now show their own colours too, because the same bug was greying them out.

Which database you're looking at: port **8050** is a server started separately with plain PHP. It reads the default `.env`, so it's showing your own local `maiic_ifrs9`, not your colleague's. Your colleague's database (`maiic_ifrs9_demo`) is the one I started on **http://127.0.0.1:8010**. Use that tab for the meeting.

Why it still looks empty on 8010: the top half will look much the same on both ports. Neither database has ECL calculated for any month except **Dec 2023**, and there's no Dec 2023 loan book, so exposure shows 0 and coverage 0%. Your colleague's data is the E-Banker loan books for Dec 2024 to Aug 2026, but ECL was never run on them. On 8010 you'll see that data in the bottom row: "Latest loan book" shows Aug 2026, 135 loans, 23.3bn.

To fill the top half, ECL has to be run for a 2026 month on the demo database. That means applying PD and LGD for the period, then running the calculation. Do you want me to try it for Aug 2026 now? It runs only on the demo copy, and your colleague's original dump stays untouched in OneDrive if we need to roll back.

USER (2026-10-09 07:42:25 UTC)

1. we are redoing the ui , from the 76 commits u pushed tyerstaday u chaged my navigation pane, showed other routed I had previously told u not to show and chnaged may things, previsoulsly all my buttons used to be on the right top side now its on the lefttop side, the navigation pane is a sole to the eyes it doesnt even look good at all , what happended, I told u to uniformize all my poages to show 15 pages and have pahe numbers and everythug ti look gid ,|

2, Im aam running the system form port 8050 and its hsowing empty I need it to show the right db with data , maje sure the env file points to that databse

CLAUDE (2026-10-09 07:42:39 UTC)

Two things, so I'll take them in order. First, pointing `.env` at the database with the data, since that's quick and you need it for the meeting.

Tool call: Bash

```
description: Point main .env at the demo database
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && cp .env ".env.bak-2026-10-09-pre-demo" && sed -i 's/^DB_DATABASE=maiic_ifrs9$/
DB_DATABASE=maiic_ifrs9_demo/' .env && grep -E "^DB_DATABASE" .env && php artisan config:clear 2>&1 | tail -1 && php artisan
tinker --execute='echo DB::getDatabaseName()." loan_books=".DB::table("loan_books")->count().PHP_EOL;' < /dev/null 2>&1 | tail
-1; git check-ignore -q ".env.bak-2026-10-09-pre-demo" && echo ignored
```

Result of Bash [error]

```
Exit code 1
DB_DATABASE=maiic_ifrs9_demo

maiic_ifrs9_demo loan_books=6732
```

Tool call: Bash

```
description: Keep .env backup under an ignored name and check 8050
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && mv ".env.bak-2026-10-09-pre-demo" .env.backup && git check-ignore .env.backup && curl -s -o /

 /*
 |--------------------------------------------------------------------------
-| MAIIC IFRS 9 - contract-aligned navigation
+| MAIIC IFRS 9 - the Dupleix-suite navigation (spec v4 section 11, D24)
 |--------------------------------------------------------------------------
-| Groups mirror the Schedule 1 solution components of the MAIIC-Dupleix
-| implementation agreement (data onboarding, collateral, EIR, IFRS 9 model
-| setup, ECL engine, reports, audit trail, dashboard, administration).
+| Six working groups, each with its own colour, in the order a finance
+| officer does the work: what comes in (Data Foundation), the rules the
+| engines obey (Governance Centre), the engines (Financial Modelling), the
+| regulatory views (Risk & Regulatory), the watch-lists (Monitoring) and
+| what goes out (Report Hub), then System Documentation and Administration.
 |
-| Duplication rules applied (nav audit, Aug 2026):
-|  - The four report/export screens that lived under "Customer & Loan Data"
-|    (Disbursements, Loan Book Reconciliation, Loan Book Export, ECL Export)
-|    are reports - they live under Reports, next to the hub.
-|  - ECL Reconciliation (the richest reconciliation page) is surfaced; it was
-|    previously reachable only through the hidden legacy /report hub.
-|  - The EIR trio (Accounting Rules -> Schedule Intake -> Fee Classification)
-|    is one pipeline and sits together in one group.
-|  - Early Warning System & AI Executive Commentary are tiles INSIDE the
-|    IFRS 9 Reports hub - they are not duplicated as menu items.
-|  - Regression Analysis is forward-looking model fitting; it lives under
-|    the Forward-Looking Model group, not a separate Analytics group.
-|  - The IFRS 9 Reports hub contains the full 30-report catalogue (incl. the
-|    Sensitivity/stress tile); the standalone Stress Testing page is the
-|    loan-level engine and is kept as a separate Reports entry.
+| Three rules behind the placement (spec 11.3): a screen that captures or
+| shows what came in is Data Foundation, whichever module uses it; a screen
+| that sets a rule the engines obey is Governance Centre; a screen that
+| produces a figure is Financial Modelling, and one that re-presents figures
+| for a regulator or a reader is Risk & Regulatory or the Report Hub.
 |
-| The sidebar renderer (Jetstream/DropdownMenu.vue) is recursive with
-| accordion behaviour, so groups may nest. Every leaf points to a real
-| registered route. The legacy /report (reports.index) is intentionally
-| NOT linked.
+| The tree is the single source of truth: HandleInertiaRequests filters it
+| by the user's permissions and sends it to the browser, which renders the
+| panel and derives the breadcrumb from it. Routes do not change; only the
+| grouping does. Every leaf names a registered route (tests/Feature/
+| NavigationTest). Every group carries an accent, one of the Tailwind
+| families written in full in resources/js/navAccents.js.
 */

-// $download=true => the route returns a file (e.g. PDF). The sidebar must
-// render it as a plain <a>, not an Inertia <Link>, or the SPA hangs trying
-// to parse the binary as an Inertia response.
-// $permission hides the leaf from users who lack it (HandleInertiaRequests
-// filters the menu); it must match the permission the route's controller
-// enforces, or a user sees a link that answers 403.
-$leaf = fn ($name, $route, $icon = 'circle', $download = false, $permission = '') => [
+// $download=true => the route returns a file; the sidebar renders a plain <a>.

CLAUDE (2026-10-07 17:44:43 UTC)

The regrouping ripples further than the sidebar: the help centre and the two manuals (rewritten screen by screen last week) name the current groups fifteen times, and MAICC's menu has a nesting level (IFRS 9 Model Setup → four sub-groups) that the FDH shell does not support. That makes the group naming a decision for you before I cut code, so here is where everything stands and the proposal.

Done this turn

- **Spec v4** written in plain language and rendered in the three formats: `3. Project Execution\specs\MAIIC_EIR_Engine_Specification_v4_2026-10-07.md / .docx / .pdf` (11 pages). One renderer (`spec_render.py`, in Build files) produces both from the markdown, so the three never drift.
- **Previous versions archived** to `9. Archive\Specifications superseded by v4 (2026-10-07)\` (the project convention is archive, not delete; OneDrive would keep them anyway). The v3 PDF is still in `specs\` because it is open in a viewer — close it and I'll move it. README repointed to v4.
- **MAICC-IFRS9** committed and pushed (`f33d6dc` on `eir_revenue_recognition`): the 15 governance settings, the proven PLR rule, spec v4 replacing v3 in `docs/`, the Codex review under `docs/reviews/`.
- **Stress-Testing-App** committed and pushed (`5be6d97a` on `main`): the Notice 1197–1201 audits, the market-risk/IRRBB labelling fix, the tools. The remote had moved on (E4/E5/E7 merges); the quarterly spec conflicted in two places and I kept both sides — the remote's "E0.3 build progress at 6 Oct" and your "E16 additions of 5 Oct" as E0.4 — and rebuilt its PDF. I did not run that repo's t

The FDH layout, and the proposed mapping for MAIIC

FDH's shell (`resources/js/nav.js`, `Components/Shell/Sidebar.vue`, `Topbar.vue`, `AppLayout.vue`) gives: one nav tree as the single source of truth; colour-accented groups with an icon tile each; a collapsible icon rail; a page header with icon, breadcrumb and actions slot; a current-period chip and dark-mode toggle in the top bar; the floating "Processing / Done" pill; and a per-page collapsible

Dupleix-suite group (accent)	MAIIC items that move there
Dashboard, Workspace (top-level)	as now
Data Foundation (teal)	Clients, Loan Book, Imports, Loan Portfolios, Sector Types, Product Groups, Collateral Register/Types/Allocation, EIR Data, Drawdowns, Reference Rates
Governance Centre (amber)	Governance Centre, Accounting Rules, Fee Classification, Staging & SICR rules, Financial Periods, Audit Trail
Financial Modelling (sky)	PD, LGD, Forward-Looking, Management Overlays, ECL Calculation, EIR Calculations, Coverage & Blockers
Risk & Regulatory (indigo)	Stress Testing, IFRS 9 Disclosure (from the hub), SICR Trigger Alerts
Monitoring (emerald)	Early Warning System, AI Commentary (today tiles inside the hub)
Report Hub (violet)	IFRS 9 Reports, ECL Reconciliation, GL Reconciliation, Loan Book Reconciliation, Disbursements
System Documentation, Administration	as now

What it costs

1. Port the five shell components and `nav.js`, with `config/menu.php` becoming the server-side permission filter only (one source of truth: the PHP config feeds the Vue tree, so permissions keep working).
2. Flatten the nested IFRS 9 Model Setup sub-groups into the Modelling group (FDH's sidebar is one level).
3. Update the 15 help-centre references and regenerate the two manuals' screenshots.
4. Brand: MAIIC navy/gold instead of FDH green — the tailwind `maiic`/`maiicgold` palettes already exist.

I'd estimate a working day, mostly in step 3. Two things I need from you: confirm (or amend) the mapping above, and whether the manuals are regenerated as part of this or in a later pass. Say go and I'll start with the shell and nav on a branch.

USER (2026-10-07 17:53:20 UTC)

adopt this Ui layout and include it in the specs
CLAUDE (2026-10-07 17:53:33 UTC)
Adopting it. Reading MAICC's current layout in full first so nothing pages depend on is lost in the port.

Tool call: AskUserQuestion

```
{
 "questions": [
  {
   "question": "Which look should MAIIC go back to for the navigation and page headers?",
   "header": "UI direction",
   "multiSelect": false,
   "options": [
    {
     "label": "Old MAIIC layout",
     "description": "Restore the sidebar, menu groups and header as they were before 8 Oct (buttons top-right, your
contract-aligned groups, hidden items hidden again). The new screens (E-Banker Feed, Take-on, EIR as at a Date, Scenario Sets,
etc.) get slotted into the old groups. Dark mode switch would be lost unless re-added."
    },
    {
     "label": "TNM Mpamba layout",
     "description": "Make the whole MAIIC shell (sidebar, top bar, headers, lists) look like TNM Mpamba, in MAIIC green and
gold, like the dashboard I just did. Buttons top-right, items you hid stay hidden."
    },
    {
     "label": "Keep new, fix it",
     "description": "Keep the 8 Oct layout but fix it: buttons back to top-right, remove the items you'd hidden, tone down the
sidebar styling."
    }
   ]
  }
 ]
}
```

Result of AskUserQuestion

```
Your questions have been answered: "Which look should MAIIC go back to for the navigation and page headers?"="Old MAIIC
layout". You can now continue with these answers in mind.
```

CLAUDE (2026-10-09 07:44:49 UTC)

Going back to the old MAIIC layout. Working out exactly which shell files the 8 Oct commit replaced and what the newer screens depend on, so nothing breaks.

Tool call: Bash

```

CLAUDE (2026-10-09 07:45:25 UTC)

The old layout, sidebar and menu are back in place. Now I'm teaching the old header to show the new screens' buttons top-right, then slotting the new screens into your old menu groups.

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\resources\js\Layouts\AppLayout.vue
--- old_string ---
                        <header class="" v-if="$slots.header">
                            <div class="mb-4">
                                <slot name="header"></slot>
                            </div>
                        </header>
--- new_string ---
                        <header class="" v-if="$slots.header || $slots.actions || description">
                            <div class="mb-4 flex flex-wrap items-start justify-between gap-3">
                                <div class="min-w-0 flex-1">
                                    <slot name="header">
                                        <h2 class="font-semibold text-xl text-gray-800 leading-tight">{{ title }}</h2>
                                        <p v-if="description" class="mt-0.5 text-sm text-gray-500">{{ description }}</p>
                                    </slot>
                                </div>
                                <!-- Page buttons sit top right -->
                                <div v-if="$slots.actions" class="flex flex-none flex-wrap items-center gap-2"><slot
name="actions"/></div>
                            </div>
                        </header>
{
 "replace_all": false
}
```

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\resources\js\Layouts\AppLayout.vue
--- old_string ---
        title: String,
        menu: [Object, Array]
    },
--- new_string ---
        title: String,
        description: String,
        menu: [Object, Array]
    },
{
 "replace_all": false
}
```

Result of Edit

```
The file c:\xampp\htdocs\MAICC-IFRS9\resources\js\Layouts\AppLayout.vue has been updated successfully.

```

CLAUDE (2026-10-09 07:45:38 UTC)

The old layout has no theme switch, so a computer set to dark mode would get dark pages inside a light frame. I'm making the restored layout light-only, as it was before.

Tool call: Bash

```
description: Read the pre-paint theme script
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -n 10,25p resources/views/app.blade.php
```

Result of Bash

```
        <!-- The theme before the page paints, so there is no flash of the wrong
             theme: the saved choice (maiic.theme) or, for "follow the device"
             and for a new browser, the device setting (spec v4 section 11.5). -->
        <script>
            (function () {
                try {
                    var t = localStorage.getItem('maiic.theme');
                    var dark = t === 'dark' || ((!t || t === 'system') && window.matchMedia('(prefers-color-scheme:
dark)').matches);
                    if (dark) document.documentElement.classList.add('dark');
                } catch (e) {}
            })();
        </script>

        <!-- Fonts -->
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

Tool call: Bash

```
description: Read the theme composable and its users
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && cat resources/js/composables/useTheme.js; grep -rln "useTheme" resources/js | head
```

Result of Bash

```
import { ref } from 'vue';
import { router } from '@inertiajs/vue3';

/**
 * Light, dark, or follow the device (spec v4 section 11.5).
 *
 * Tailwind runs in class mode, so the whole system is dark when the `dark`
 * class is on <html> and light when it is not; nothing else decides the
 * theme. The first paint is set by the four-line script in app.blade.php,
 * which reads `maiic.theme` from the browser before the page renders; this
 * composable mirrors that state in one module-level ref, so the top-bar
 * switch, the profile page and any other consumer stay in step. The choice
 * is kept in the browser (so the first paint is right) and on the user's
 * record (so it follows the user to another machine).
 */
const STORAGE_KEY = 'maiic.theme';
export const THEMES = ['light', 'dark', 'system'];

== new admin group:
| what goes out (Report Hub), then System Documentation and Administration.
|
| Three rules behind the placement (spec 11.3): a screen that captures or
| shows what came in is Data Foundation, whichever module uses it; a screen
| that sets a rule the engines obey is Governance Centre; a screen that
| produces a figure is Financial Modelling, and one that re-presents figures
| for a regulator or a reader is Risk & Regulatory or the Report Hub.
|
| The tree is the single source of truth: HandleInertiaRequests filters it
| by the user's permissions and sends it to the browser, which renders the
| panel and derives the breadcrumb from it. Routes do not change; only the
| grouping does. Every leaf names a registered route (tests/Feature/
| NavigationTest). Every group carries an accent, one of the Tailwind
| families written in full in resources/js/navAccents.js.
*/

CLAUDE (2026-10-09 07:46:38 UTC)

The navigation test still checks for the coloured groups, so I'm updating it to match the restored menu. It also gains a check that the hub tiles stay out of the menu.

The MAIIC layout restored: the contract-aligned menu, the old sidebar and header, buttons top right

The Dupleix-suite shell of 8 October (c84898f) is reverted for the sidebar, the menu and the page header, at Wadzanai's
request: AppLayout, SidebarNav, DropdownMenu and config/menu.php are back to 3b8c0bf. The screens added since then sit in the
old groups: E-Banker Feed and Take-on Schedules under Customer & Loan Data, EIR as at a Date under EIR, Scenario Sets,
Correlation Finder and Manual Overlays under the forward-looking model, Mega Farm under ECL Processing, RBM Return and Auditor
Pack under Reports, Audit Trace and Compliance Audits under Administration. The report-hub tiles are not repeated as menu items,
 as before. Regression Analysis opens FLI Adjustments (audit M6) and the permissions the audit added are kept. The header takes
the new pages' actions slot and description on the right, so their buttons stay top right. Light only: the restored layout has
no appearance switch, so the pre-paint script pins the theme to light. NavigationTest follows the restored tree.

CLAUDE (2026-10-09 07:49:07 UTC)

Layout committed (`4fd3dd5`). Now the 15-rows-per-page change. TNM already has it, so I'm checking how it was done there to copy the same approach.

Tool call: Bash

```
description: Inspect TNM's 15-per-page commit
--- command ---
cd /c/xampp/htdocs/TNMMpamba && git show --stat --format="%h %s%n%b" bfbb33a | head -40; git log --oneline -i --grep="15 a page\
|per page\|paginat" | head -5
```

Result of Bash

```
bfbb33a Every list 15 a page; comparison rows show their PD/LGD windows
- All paginated lists now show 15 rows a page (ECL calculation and Loan
  Book were 10, Audit Trail 30, Stage Movement detail 50, older screens 20).
- Methodology comparison: each month row says what it covers. The month is
  the reporting month (loan book at month-end) and, under it, the windows
  its PD/LGD were pooled over, e.g. "B: Dec 2023 to Mar 2025" and "C: Apr
  2024 to Mar 2025 (10 pooled)", without opening the stage detail.
- Manual and pictures updated.

CLAUDE (2026-10-09 07:49:27 UTC)

Your Pagination component already shows page numbers, so the main job is the row count: 77 calls use something other than 15. Listing them.

Tool call: Bash

```
description: List non-15 pagination calls by file
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -rnoE "(simple)?[pP]aginate\(\s*[0-9]+" app | grep -vE "\(\s*15\b" | awk -F: '{print
$1": "$3}' | sort | uniq -c | sort -k2 | awk '{print $1, $2, $3, $4}' | head -90; echo; grep -rn "simplePaginate" app | wc -l
```

Result of Bash

```

```

CLAUDE (2026-10-09 07:49:37 UTC)

All 77 are in the controllers. Setting every one to 15, plus the two that read the size from a variable (Audit Trail at 25, Communication Log defaulting to 20).

Tool call: Bash

```
description: Set all controller pagination to 15 rows
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -rlE "paginate\(\s*[0-9]+" app/Http/Controllers | xargs sed -i -E 's/paginate\(\s*([0-9]|
1[0-46-9]|[2-9][0-9]|[0-9]{3,})(\s*[,)])/paginate(15\2/g' && sed -i 's/\$perPage = 25;/$perPage = 15;/' app/Http/Controllers/
AuditTrailController.php && sed -i 's/\$perPage = \$request->per_page ?: 20;/$perPage = $request->per_page ?: 15;/' app/Http/
Controllers/CommunicationLogController.php && echo "left non-15:" && grep -rnoE "paginate\(\s*[0-9]+" app | grep -vE "\(15\b" |
wc -l && for f in $(git diff --name-only -- app); do php -l $f | grep -v "No syntax"; done; git diff --stat -- app | tail -1
```

Result of Bash

```

CLAUDE (2026-10-09 07:50:55 UTC)

Audit Trail and Discounted Payments have their own Previous/Next pager with no page numbers. Adding numbered pages to both.

Tool call: Bash

```
description: Read the two inline pagers
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -n 86,100p resources/js/Pages/AuditTrail/Index.vue; grep -n -E "function go|go\(|const go|
methods|<script" resources/js/Pages/AuditTrail/Index.vue | head; echo =====; sed -n 150,195p resources/js/Pages/
DiscountedPayments/Index.vue; sed -n 280,320p resources/js/Pages/DiscountedPayments/Index.vue
```

Result of Bash

```
            </table>
        </div>

        <!-- pagination -->
        <div class="mt-4 flex items-center justify-between text-sm text-gray-600">
            <span>Page {{ pagination.current_page }} of {{ pagination.last_page }} · {{ pagination.total.toLocaleString() }}
entries</span>
            <div class="flex gap-2">
                <button :disabled="pagination.current_page <= 1" @click="go(pagination.current_page - 1)"

[screenshot pasted by the user: not reproduced in this transcript]

what happening ehre , do we even have data in this databse , wc database is the system running from in the env fole , l told u lm running the system locally on port 8050

2. lets show reportd as the report hub wc people click and the reports are shown insde just like how the tnm reports are showing also make the icons on the avigation pane coloured just like how it is for tnm mpamaba and make sure the navigation pane colour for the things headers in nicer
3. make sure on settings the ui only shows settings that go woith the ifrs9 system remove all other that mentioned eswatini crdit scoring
4. Deploy agents to see the whole ui as it is , and mke sure it looks nice and formatted well and professional just like the tnm , errors show nicely formatted boxes and all the other chnages we did to the ui for the tnm mpamaba so that it look nice , also maje sure reports download nicely and are formatted nicely,make sure the dahsboard is exported as well, also put staging basis as we did in tnm if it applies and , also audit the navigation pane such that if its dots or those lighting lines u put in tnm are implemented for all the new ones added . l need u to audit all screems end to end and make sure there is unifomroty

all imports should have instructions impot buttons download sample cvs and clearly labbelled tabs or buttons, no screen should scroll down like a long thing , l need to see clearly labels and well done tables and icons for actions of editing deleting etc well done , if a page is holding more than 1 work makje sure to separtate those things as tabs as we did on tnm

l hope u are pushing all chnages to master

cd /c/xampp/htdocs/MAICC-IFRS9 && git add -u app/Http/Controllers resources/js/Components/Pagination.vue resources/js/Jetstream/
Pagination.vue resources/js/Shared/Pagination.vue resources/js/Pages/AuditTrail/Index.vue resources/js/Pages/DiscountedPayments/
Index.vue && git commit -q -F - <<'EOF'
Every list 15 a page, with page numbers on one pager

All server-paginated lists show 15 rows a page (they were 5, 10, 20, 25 or 30). The three pager components now render one
design: numbered pages, the current page in MAIIC green, Previous and Next with their labels decoded. Audit Trail and
Discounted Payments, which had only Previous and Next, gain numbered pages.

CLAUDE (2026-10-09 08:08:19 UTC)

Committed (`b84f182`). Now looking at how TNM does its Report Hub and coloured navigation icons, so MAIIC can copy it.

Tool call: Bash

```
description: Inspect TNM menu, reports and sidebar components
--- command ---
cd /c/xampp/htdocs/TNMMpamba && grep -n -i -E "report|group\(|accent|color|colour" config/menu.php | head -40; ls resources/js/
Jetstream | grep -i -E "sidebar|dropdown|nav"; ls resources/js/Pages | grep -i report
```

Result of Bash

```
9:| calculate ECL -> report. Administration and documentation sit last.
22:// 'color' on a top-level item tints its sidebar icon (bright on the dark green).
39:        ['color' => '#FED928'] + $leaf('Dashboard', 'dashboard', 'home'),
42:        // reconciliation, operational report and export.
43:        ['color' => '#F6B131'] + $leaf('Reports', 'reports.index', 'file-alt', false, 'reports.*'),
47:        // report and export is reached from the Reports hub.

<?php

/*
|--------------------------------------------------------------------------
| TNM IFRS 9 - grouped navigation
|--------------------------------------------------------------------------
| Groups follow the order a month-end IFRS 9 run is done in:
| load the data -> build PD -> build LGD -> forward-looking overlay ->
| calculate ECL -> report. Administration and documentation sit last.
|
| The system is IFRS 9 only. Credit-scoring and loan-origination screens
| (loan applications, scoring attributes, approval stages, score bands,
| communication campaigns, client financial statements) are deliberately
| not linked. Their routes still exist so old bookmarks fail politely.
|
| The sidebar renderer (Jetstream/DropdownMenu.vue) is recursive, so a
| group may nest. Every leaf must point to a registered GET route: Ziggy's
| route() throws on an unknown name and that blanks the whole sidebar.
| tests/Feature/NavigationMenuTest.php enforces this.
*/

// 'color' on a top-level item tints its sidebar icon (bright on the dark green).
// $download=true => the route returns a file (e.g. PDF). The sidebar must
// render it as a plain <a>, not an Inertia <Link>, or the SPA hangs trying
// to parse the binary as an Inertia response.
$leaf = fn ($name, $route, $icon = 'circle', $download = false, $check = null) => [
    'name' => $name, 'icon' => $icon, 'route' => $route, 'route_check' => $check ?? $route,

Result of AskUserQuestion

```
Your questions have been answered: "Pushing to master triggers .github/workflows/deploy.yml, which SSHes into the MAIIC
production server and deploys (if its secrets are set). Where should today's changes go?"="Push to eir_revenue_recognition",
"The demo database has E-Banker loan books for Dec 2024 to Aug 2026 but ECL was only ever calculated for Dec 2023, which is why
the dashboard shows Dec 2023 with zero exposure. Should I run the ECL chain (apply PD and LGD, calculate ECL) for the 2026
months on the demo database?"="Yes, all 2026 months". You can now continue with these answers in mind.
```

CLAUDE (2026-10-09 08:09:11 UTC)

Pushing the commits so far to `eir_revenue_recognition`, after checking nobody else has pushed in the meantime.

Tool call: Bash

```
description: Fetch and push working branch
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git fetch -q origin && git status -sb | head -1 && git log --oneline origin/
eir_revenue_recognition..HEAD && git push -q origin eir_revenue_recognition 2>&1 | tail -2; git status -sb | head -1
```

Result of Bash

```
## eir_revenue_recognition...origin/eir_revenue_recognition [ahead 4]
b84f182 Every list 15 a page, with page numbers on one pager
4fd3dd5 The MAIIC layout restored: the contract-aligned menu, the old sidebar and header, buttons top right
5cb5151 Tailwind scans resources/js/**/*.js, so the group colours in navAccents.js are built
72f907d Dashboard in the TNM Mpamba layout, in the MAIIC palette
## eir_revenue_recognition...origin/eir_revenue_recognition
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 08:09:51 UTC)

Pushed to `eir_revenue_recognition` (4 commits, no deploy). Next I'm setting up shared helpers so the agents can take screenshots and build without tripping over each other.

Tool call: Bash

```
description: Create shared build, login and screenshot helpers
--- command ---

CLAUDE (2026-10-09 08:11:12 UTC)

The assets returned 404 because the server was rooted at the project folder instead of `public`. Restarting it correctly.

description: Run ECL chain 2026 on demo
--- prompt ---
You are running the MAIIC IFRS 9 system's own ECL chain on a DEMO database so the dashboard shows the current book. Today is 9
Oct 2026; there is a client meeting today, so work efficiently.

## Context
- Laravel 10/11 + Inertia app at C:\xampp\htdocs\MAICC-IFRS9 (branch eir_revenue_recognition). PHP: `php artisan ...` from that
folder. MariaDB: `C:/xampp/mysql/bin/mysql.exe -uroot` (no password).
- The app's default `.env` now points at `maiic_ifrs9_demo`. ONLY touch `maiic_ifrs9_demo`. NEVER write to `maiic_ifrs9`,
`maiic_ifrs9_bootstrap` or any other database.
- maiic_ifrs9_demo has E-Banker loan books in `loan_books` (reporting_period 'Y-m', Dec 2024 to Aug 2026, about 120-135 loans a
month; stage column `ifrs9stage_post_qualitative`, `carrying_amount`). WARNING: 2025-11 has 3,615 rows, which looks like a GL
file wrongly imported as a loan book; do not use 2025-11 as an input period if it would contaminate PD/LGD, and mention it in
your report.
- `reporting_periods` (period is a DATE 'Y-m-01'; columns pd_id, lgd_id, pd/lgd_calculation_source, ecl_calculated,
ecl_calculation_level/id/code). `expected_credit_loss` holds results per (reporting_period, ifrs9_stage, calc level/id). Today
ECL exists only for 2023-12.
- The colleague's build report for this demo DB is docs/After_Build_Report_Demo_2026-10-08.md; also read docs/
After_Build_Report_2026-10-08.md and look in app/Console/Commands for the chain (e.g. eir:bootstrap with --run-engines, "the
chain in its final order from one command", staging, PD, LGD, ECL services). Use the system's own engines/commands/services,
the same way the bootstrap does. Where governance approval is needed, use the label the colleague used: "System Bootstrap
(automated data-readiness, not a MAIIC approval)".

## Task
1. FIRST back up the demo DB: `C:/xampp/mysql/bin/mysqldump.exe -uroot --single-transaction --routines --triggers
maiic_ifrs9_demo | gzip > "C:/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project Execution/Database Backups/
maiic_ifrs9_demo_pre-ecl_2026-10-09.sql.gz"` and confirm the file size.
2. Work out exactly what the system needs to calculate ECL for a month (staging, PD applied, LGD applied, ECL run) and run it
for each month Jan 2026 to Aug 2026 on maiic_ifrs9_demo. If the chain needs earlier months for PD/LGD history, use the data
that exists.
3. Correctness rules (strict): never hardcode or invent figures, never fall back to proxies or defaults to make a number appear;
 if a step cannot run on real data, fail closed for that month and report the exact blocker. Do NOT edit any code files in the
repo. If a code bug blocks the run, stop that path and report it with file:line and the error.
4. Verify: for each month report total EAD, total ECL, coverage %, ECL by stage, loan count, and confirm
`reporting_periods.ecl_calculated` is set so the dashboard lists the month. Sanity-check that the loan-book carrying amount for
the month roughly matches the ECL EAD.
5. Do not commit anything to git.

## Report back (concise)
Backup file path and size; the commands/services you ran in order; a per-month table (EAD, ECL, coverage, stage split, loans);
any month that failed and why; anything suspicious in the data (e.g. 2025-11). Keep it short and factual.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Result of Agent

```
Async agent launched successfully. (This tool result is internal metadata — never quote or paste any part of it, including the
agentId below, into a user-facing reply.)
agentId: a5e16a2e02407c0c4 (internal ID - do not mention to user. Use SendMessage with to: 'a5e16a2e02407c0c4', summary: '<5-10
word recap>' to continue this agent.)
The agent is working in the background. You will be notified automatically when it completes. You know nothing about its
results until that notification arrives — do not report, assume, or predict them; continue other work or respond to the user in
the meantime.
Do not duplicate this agent's work — avoid working with the same files or topics it is using.
output_file: C:\Users\DELL\AppData\Local\Temp\claude\c--xampp-htdocs-Stress-Testing-App\c9a0f915-2064-4f18-9b98-77857ef71421\
tasks\a5e16a2e02407c0c4.output
Do NOT Read or tail this file via the shell tool — it is the full subagent JSONL transcript and reading it will overflow your
context. If the user asks for progress, say the agent is still running; you'll get a completion notification.
```

USER, sent while Claude was working (2026-10-09 08:12:04 UTC)

[screenshot pasted by the user: not reproduced in this transcript]

can all the pages in the ui have a full width view , why is everything centred on a little soace , under other igation panes like the eir cant we have other pages being consolidated into 1 then pu tabs to avaoid that long list because some of things can have one header on the naviagation then be added as tabs f they relate

CLAUDE (2026-10-09 08:13:00 UTC)

Most pages cap themselves with `max-w-7xl mx-auto`. I'm removing that cap from page wrappers only (pop-up dialogs keep their sizes), so every page uses the full width.

Tool call: Bash

```
description: Widen page wrappers to full width
--- command ---
cat > "C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/fullwidth.py" <<'PYEOF'
import re, pathlib
root = pathlib.Path(r'c:\xampp\htdocs\MAICC-IFRS9\resources\js\Pages')
cap = re.compile(r'^max-w-(4xl|5xl|6xl|7xl|screen-(lg|xl|2xl))$')
changed = 0
def fix(m):
    global changed
    cls = m.group(1).split()
    if 'mx-auto' not in cls or not any(cap.match(c) for c in cls):
        return m.group(0)
    if any(c.startswith(('max-h', 'shadow', 'rounded', 'fixed', 'absolute')) for c in cls):
        return m.group(0)  # a dialog or card, not a page wrapper
    keep = [c for c in cls if not cap.match(c) and c not in ('mx-auto', 'sm:px-6', 'lg:px-8')]
    if 'w-full' not in keep:
        keep.insert(0, 'w-full')
    changed += 1
    return 'class="' + ' '.join(keep) + '"'
files = 0
for f in root.rglob('*.vue'):
    s = f.read_text(encoding='utf-8')
    n = re.sub(r'class="([^"]*)"', fix, s)
    if n != s:
        f.write_text(n, encoding='utf-8', newline='') if False else open(f, 'w', encoding='utf-8', newline='').write(n)
        files += 1
print(files, 'files,', changed, 'wrappers widened')
PYEOF
python "C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/fullwidth.py"; cd /c/xampp/htdocs/MAICC-IFRS9 && git diff --stat | tail -1
```

Result of Bash

```

/*
|--------------------------------------------------------------------------
| MAIIC IFRS 9 - contract-aligned navigation
|--------------------------------------------------------------------------
| Groups mirror the Schedule 1 solution components of the MAIIC-Dupleix
| implementation agreement (data onboarding, collateral, EIR, IFRS 9 model
| setup, ECL engine, reports, audit trail, dashboard, administration).
|
| Duplication rules applied (nav audit, Aug 2026):
|  - The four report/export screens that lived under "Customer & Loan Data"
|    (Disbursements, Loan Book Reconciliation, Loan Book Export, ECL Export)
|    are reports - they live under Reports, next to the hub.
|  - ECL Reconciliation (the richest reconciliation page) is surfaced; it was
|    previously reachable only through the hidden legacy /report hub.
|  - The EIR trio (Accounting Rules -> Schedule Intake -> Fee Classification)
|    is one pipeline and sits together in one group.
|  - Early Warning System & AI Executive Commentary are tiles INSIDE the
|    IFRS 9 Reports hub - they are not duplicated as menu items.
|  - Regression Analysis is forward-looking model fitting; it lives under
|    the Forward-Looking Model group, not a separate Analytics group.
|  - The IFRS 9 Reports hub contains the full 30-report catalogue (incl. the
|    Sensitivity/stress tile); the standalone Stress Testing page is the
|    loan-level engine and is kept as a separate Reports entry.
|
| The sidebar renderer (Jetstream/DropdownMenu.vue) is recursive with
| accordion behaviour, so groups may nest. Every leaf points to a real
| registered route. The legacy /report (reports.index) is intentionally
| NOT linked.
*/

// $download=true => the route returns a file (e.g. PDF). The sidebar must
// render it as a plain <a>, not an Inertia <Link>, or the SPA hangs trying
// to parse the binary as an Inertia response.
// $permission hides the leaf from users who lack it (HandleInertiaRequests
// filters the menu); it must match the permission the route's controller
// enforces, or a user sees a link that answers 403.
$leaf = fn ($name, $route, $icon = 'circle', $download = false, $permission = '') => [

/*
|--------------------------------------------------------------------------
| MAIIC IFRS 9 - contract-aligned navigation, with tabbed sections
|--------------------------------------------------------------------------
| Groups mirror the Schedule 1 solution components of the MAIIC-Dupleix
| implementation agreement (data onboarding, collateral, EIR, IFRS 9 model
| setup, ECL engine, reports, audit trail, dashboard, administration).
|
| Rules (nav audit, Aug 2026, and the consolidation of 9 October 2026):
|  - Reports is one entry: the hub. Every report, reconciliation and export
|    is reached from the hub, never listed beside it.
|  - Screens that do one job together are one menu entry with tabs (a
|    $section). The tab bar is drawn by the layout from 'tabs'; each tab is
|    the screen's own route, so links and bookmarks keep working.
|  - The report-hub tiles (Early Warning, AI Commentary, Executive Summary,
|    the ifrs9-reports.* views) are never menu items.
|  - The legacy /report (reports.index) and the legacy one-click regression
|    screen (system audit of 9 October 2026, finding M6) are not linked.
|
| 'color' on a top-level item tints its sidebar icon (bright on the dark
| green). 'match' lists further route patterns that light the entry up.
| Every route named here must be registered (tests/Feature/NavigationTest).

CLAUDE (2026-10-09 08:14:24 UTC)

The menu is written. Now I'm teaching the server to hide tabs a user isn't allowed to open, then the sidebar and the tab bar.

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\app\Http\Middleware\HandleInertiaRequests.php
--- old_string ---
            if (! empty($item['dropdown'])) {
                $item['children'] = $this->visibleMenu($item['children'] ?? []);
                if ($item['children'] === []) {
                    continue;
                }
            }
--- new_string ---
            if (! empty($item['dropdown'])) {
                $item['children'] = $this->visibleMenu($item['children'] ?? []);
                if ($item['children'] === []) {
                    continue;
                }
            }
            // A tabbed section keeps the tabs the user may open, and opens the first.
            if (! empty($item['tabs'])) {
                $item['tabs'] = array_values(array_filter($item['tabs'], fn ($t) => ($t['permissions'] ?? '') === '' || ($user

Tabbed sections and a TNM-style sidebar: Reports as one hub entry, related screens as tabs, coloured icons

The menu keeps the contract groups but consolidates screens that do one job together into one entry with tabs ($section in
config/menu.php): Portfolio Setup, Collateral Management, Imports & Feeds, EIR Data, EIR Rules, EIR Calculations, Staging &
SICR Rules, PD Model, LGD Model, Forward-Looking Model, Scenarios & Overlays, Users & Roles and Audit. The layout draws the tab
bar from the menu, each tab being the screen's own route, so links and bookmarks keep working; HandleInertiaRequests drops tabs
the user may not open. Reports is one entry to the hub. The sidebar follows TNM Mpamba: a colour per top-level icon, group
names in sentence case, children on a guide line with a gold marker on the current page. menuMatch.js decides the current entry
and tab, the most specific route pattern winning.

CLAUDE (2026-10-09 08:18:43 UTC)

Writing one shared brief for all the screen agents so they follow the same rules, then launching them.

Tool call: Write

```
file_path: C:\Users\DELL\AppData\Local\Temp\claude\c--xampp-htdocs-Stress-Testing-App\c9a0f915-2064-4f18-9b98-77857ef71421\
scratchpad\tools\BRIEF.md
--- content ---
# MAIIC UI overhaul - shared brief (9 Oct 2026)

Read this whole file before you start. Several agents work in the SAME working tree at the same time, each on its own files.

## The system
- Laravel + Inertia + Vue 3 + Tailwind app: `C:\xampp\htdocs\MAICC-IFRS9`, branch `eir_revenue_recognition`. IFRS 9 ECL and EIR
platform for MAIIC (Malawi Agricultural and Industrial Investment Corporation). It was cloned from an older generic loans/
medical platform, so it carries legacy screens.
- Database: `maiic_ifrs9_demo` (MariaDB, `C:/xampp/mysql/bin/mysql.exe -uroot`, no password). The app's `.env` points at it.
NEVER write to `maiic_ifrs9` or any other database. Do not change data unless your task says so.
- Brand: Tailwind palettes `maiic` (green, 50-900) and `maiicgold` (400-600). Shared classes in `resources/css/app.css`:
`maiic-panel`, `maiic-table` (+ `maiic-table-wrap`, `num`, `tr.total`), `maiic-badge` (+ `-green`, `-gold`, `-red`, `-grey`,
`-solid-green`), `maiic-kpi` (+ `-label`, `-value`), `maiic-filterbar`, `maiic-flabel`, `maiic-input`, `maiic-select`,
`maiic-action` (+ `-view` eye, `-edit` pencil, `-delete` bin, `-neutral`), `maiic-section-title`, `maiic-empty`. Light mode
only.
- Layout `resources/js/Layouts/AppLayout.vue`: page header comes from the `#header` slot (title left) and the `#actions` slot
(buttons, rendered TOP RIGHT), or the `title`/`description` props. Pages are full width now (no `max-w-7xl mx-auto` page
wrappers; do not add them back).
- Navigation `config/menu.php`: related screens are grouped as SECTIONS with TABS. The layout draws the tab bar automatically
above the page header for any route listed in a section's `tabs`. So a page must NOT draw its own copy of those tabs. Read
config/menu.php to see which section/tabs your screens belong to.
- Pagination: every server list is 15 rows a page; `resources/js/Components/Pagination.vue` is the one pager (numbered pages).
Use it on every paged list.
- Fontawesome icons must be registered in `resources/js/app.js` (library.add). If you need a new icon, report it to the
coordinator instead of editing app.js (shared file) - or use an inline SVG.

## The reference design: TNM Mpamba
`C:\xampp\htdocs\TNMMpamba` (branch feature/ifrs9-ui-overhaul) is the same platform, already overhauled. READ ONLY - never edit
it. Look at its pages for the patterns to copy (its classes are `tnm-*`; in MAIIC use the `maiic-*` equivalents and MAIIC
colours):
- page header with title + one-line description left, action buttons right;
- tabs on a page that holds more than one job (e.g. its Settings, PD/LGD pages, methodology comparison) instead of one long
scrolling page;
- import screens: a short "how to" instructions panel, a "Download sample CSV" button, the upload button, clearly labelled tabs
(e.g. Upload / History);
- tables with header band, zebra rows, right-aligned numbers, icon actions (view / edit / delete) using `maiic-action-*`;
- errors and messages in nicely formatted boxes (icon, title, text), not raw text or browser alerts;
- empty states that say what to do next;
- reports and exports (PDF/Excel) branded and formatted.
Find TNM's equivalents with grep/glob under `C:\xampp\htdocs\TNMMpamba\resources\js\Pages` and `resources\views`.

## Standards every screen must meet
1. Header: title + one-line plain-English description left; actions top right.
2. No long scrolling page: if a page holds more than one job, split it into in-page tabs (simple Vue tab state, styled like the
layout's tab bar: `border-b` row, active tab `border-b-2 border-maiic-600 text-maiic-800`). Long tables paginate at 15 (server
side if the data is server paged; else a small client-side pager showing 15 rows with numbered pages).
3. Tables: `maiic-table` inside `maiic-panel`, numbers right-aligned with `num`, icon action buttons with titles (tooltips),
consistent badges.
4. Forms: labelled fields (`maiic-flabel` + `maiic-input`/`maiic-select`), validation errors shown under the field, primary
button MAIIC green.
5. Imports: instructions, "Download sample CSV" (a real CSV with the exact headers the importer accepts - build the sample from
the importer's code, never guess), upload, history; clearly labelled.
6. Plain English, short, no em dashes (use commas or plain hyphens), no jargon the finance team would not use. Spec references
like "(spec v4 section 12.5)" do not belong on screen; remove them from visible text.
7. Correctness: never hardcode figures or fake data to make a screen look full; an empty state is fine.

## Tools (use these, they are serialised/safe)
- App for screenshots: http://127.0.0.1:8070 (NOT 8050, that one is the user's).
- Log in (creates a session): `bash TOOLS/login.sh TOOLS/c_<yourname>.json`
- Screenshot: `node TOOLS/shot.cjs TOOLS/c_<yourname>.json <out.png> <path e.g. eir-coverage> [width]` (prints status + JS
errors). Look at the PNG with the Read tool.
- Log out when finished: `bash TOOLS/logout.sh TOOLS/c_<yourname>.json`
- Build assets: ONLY `bash TOOLS/build.sh` (it waits for a lock). Never run `npm run build` or `npm run dev` directly.
- TOOLS = `C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/tools`. Save your screenshots under TOOLS/shots/<yourname>/.
- Find a route's URL: `cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan route:list --name=<name>`.

## Git
- Commit only the files you changed: `git add <exact paths>` (never `git add -A`, `.` or `-u` without paths). Commit messages:
plain, ASCII hyphens only (no em/en dashes), end with a blank line then `Co-Authored-By: Claude Opus 5.5
<noreply@anthropic.com>`. Do NOT push.
- If `.git/index.lock` exists, another agent is committing: wait a few seconds (`node -e "setTimeout(()=>{},4000)"`) and retry.
- Files owned by the coordinator - do NOT edit: `config/menu.php`, `resources/js/Layouts/AppLayout.vue`, `resources/js/
Jetstream/DropdownMenu.vue`, `SidebarNav.vue`, `menuMatch.js`, `app/Http/Middleware/HandleInertiaRequests.php`, `resources/
views/app.blade.php`, `resources/js/app.js`, `resources/css/app.css`, `tailwind.config.js`, `resources/js/Components/
Pagination.vue`. If you need a change in one, describe it in your final report.
- Stay inside your scope. If a screen in your scope is also listed in another agent's scope, skip it.

## Final report (keep it short)
What you changed per screen (one line each), commits made, screenshots taken, anything you could not fix and why, and any
change you need in a coordinator-owned file.

Tool call: Agent

```
description: Reports hub, downloads, dashboard PDF
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md and follow it exactly. Your name for tools/screenshots:
"reports".

## Your scope: the Report Hub, report downloads, and the dashboard export (MAICC-IFRS9)
The sidebar now has ONE "Reports" entry pointing at route `ifrs9-reports.index` (page resources/js/Pages/Reports/Ifrs9/
Index.vue, controller for ifrs9-reports.*). The user wants it to work like TNM Mpamba's Reports hub (C:\xampp\htdocs\TNMMpamba,
route reports.index, resources/js/Pages/Reports/ - read it): people click Reports and every report is shown inside the hub,
grouped and clearly labelled, one click to open.

1. Make the hub list EVERY report screen of MAIIC, grouped into clear categories (for example: IFRS 9 ECL reports,
Reconciliations, Regulatory (RBM), EIR reports, Stress & sensitivity, Exports & packs). Besides the existing ~30-report
catalogue it must include these screens that used to be separate menu items: ECL Reconciliation (reports.ecl-reconciliation),
Loan Book Reconciliation (reports.loan-book-reconciliation), Disbursements (Vintage) (reports.disbursement-report), Stress
Testing (stress-testing.index), RBM Return (provisional) (rbm-return.index), Auditor Pack (auditor-pack.index, permission
eir.export), GL Reconciliation (EIR) (eir-reconciliation.index, eir.view), EIR as at a Date (eir-as-at.index, eir.view).
Respect permissions (hide a tile the user cannot open). Each tile: icon, name, one-line description of what the report answers,
and the download formats it offers. Consider tabs per category so the hub is not one long page. Make sure each report page
opened from the hub has a clear "Back to reports" link and its download buttons top right.
2. Report downloads: check every report's PDF / Excel / CSV export actually downloads (hit the routes, e.g. with curl using the
session cookie, or puppeteer) and is formatted nicely: MAIIC branding (logo: see how existing PDFs or HandleInertiaRequests get
the logo; company name from settings), title, period, prepared-on date, clean tables with right-aligned numbers, page numbers.
Compare with TNM's PDFs (resources/views/reports/*.blade.php in TNM, e.g. dashboard_ecl_pdf.blade.php) and bring MAIIC's to
that standard. Fix broken ones.
3. Dashboard export: TNM has a "Download ECL report (PDF)" button on its dashboard (DashboardController::eclReportPdf, route
dashboard.ecl-report-pdf, view reports/dashboard_ecl_pdf.blade.php, plus PdfCharts). Port it to MAIIC: route + controller
method in MAIIC's app/Http/Controllers/DashboardController.php (built from the SAME figures the dashboard index shows for the
selected period/portfolio/compare - reuse, don't recompute differently), a MAIIC-branded Blade PDF, and a "Download dashboard
(PDF)" button in the `#actions` slot of resources/js/Pages/Dashboard.vue (pass the current period, portfolio and compare). Use
whatever PDF library MAIIC already uses (check composer.json, e.g. barryvdh/laravel-dompdf). You may add the route to routes/
web.php (only that line).
Files you own: resources/js/Pages/Reports/** , resources/js/Pages/Dashboard.vue, app/Http/Controllers/DashboardController.php,
report controllers (Ifrs9Report*, Reports*, StressTesting*, RbmReturn*, AuditorPack*, EirAsAt*, EirReconciliation* controllers),
 resources/views/reports/** and other PDF views of those reports, and one new route line in routes/web.php. Do not edit EIR
non-report screens (another agent owns them).

Verify with screenshots (hub + a few reports) and by opening downloaded files (for PDFs, you can render page 1 to PNG with
pdftoppm if available, or check size/content). Build with TOOLS/build.sh. Commit in logical chunks. Final report per the brief.

description: Settings cleanup, staging, errors
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md and follow it exactly. Your name for tools/screenshots:
"settings".

## Your scope (MAICC-IFRS9)
1. Settings (route settings.index and every settings.* page, resources/js/Pages/Settings/**, the SettingsController(s)): the
system was cloned from an Eswatini credit-scoring / loan-origination / medical platform. The user wants Settings to show ONLY
what belongs to an IFRS 9 ECL and EIR system. Remove from the Settings UI everything that mentions Eswatini, credit scoring,
score bands, loan bands, loan origination/approval, SMS gateways, billing, tariffs, invoices, patients, etc. Keep: organisation
details (name, logo, address), reporting currency, financial year / periods if there, email if used for notifications, system
options the IFRS 9/EIR engines read. Check what each setting is actually read by in code (grep the setting key) before removing
it from the UI; if an IFRS 9 engine reads it, keep it. Hide by removing from the Settings screens and their navigation/tabs; do
not delete routes, tables or data. Look at TNM Mpamba's Settings (C:\xampp\htdocs\TNMMpamba, resources/js/Pages/Settings/**,
its SettingsController) for how it was done there and the tabbed layout to copy. Make Settings a clean tabbed screen, every
field labelled with a one-line help text.
2. Staging basis: TNM has a "Staging Basis" screen (route settings.staging.index: one basis per month, e.g. creation date vs
payment due date). Investigate whether the same concept applies to MAIIC: MAIIC stages under the RBM DFI directive thresholds
(staging_thresholds, StagingThresholdSeeder, StagingClassifier) with days past due counted from a date, and governed settings
live in the Governance Centre (eir-governance.index). If MAIIC has a staging-basis choice (which date drives days past due, or
a per-month basis), surface it clearly in the UI where it belongs (prefer showing the governed value read-only with a link to
the Governance Centre over creating a second editable copy - one source of truth). If it does not apply, say so in your report
with the reason. Do not change how staging is calculated.
3. Error and message boxes, system-wide: flash messages (resources/js/Jetstream/FlashMessages.vue and similar), validation
error lists (ValidationErrors / InputError components), and any `alert(` / `confirm(` browser dialogs in resources/js/Pages.
Make flash/validation messages nicely formatted boxes like TNM (icon, title, message, colour by type: success green, error red,
warning amber, info), dismissible. For confirm() delete prompts, if there is a shared confirmation modal component in MAIIC or
TNM, report how many pages use raw confirm() and convert the shared/common ones you can safely do; list the rest in your
report. Note AppLayout.vue (coordinator-owned) already has an error modal for 403/419/404/500 - do not edit AppLayout; if it
needs a change, report it.
Files you own: resources/js/Pages/Settings/**, Settings controllers and their views, resources/js/Jetstream/FlashMessages.vue,
resources/js/Jetstream/ValidationErrors.vue, resources/js/Jetstream/InputError.vue (and Components equivalents), any new shared
component you create under resources/js/Components/ (e.g. ConfirmDialog.vue). Do not edit menu.php (if Settings needs a menu
change, report it).

Verify with screenshots before/after, build with TOOLS/build.sh, commit in logical chunks. Final report per the brief.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Tool call: Agent

```
description: Audit data screens and imports
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md and follow it exactly. Your name for tools/screenshots: "data".

## Your scope (MAICC-IFRS9): audit and fix, end to end
Menu entries (see config/menu.php): Portfolio Setup (tabs Loan Portfolios / Product Groups / Sector Types), Customer & Loan
Data (Clients, Loan Book, Imports & Feeds with tabs Imports / E-Banker Feed / Take-on Schedules), Collateral Management (tabs
Register / Allocation / Types). Plus EVERY import screen anywhere in the system (loan book import, client import, collateral
imports, reference-rate import, EIR data/intake import, macro statistics import, trial balance import, etc.): find them with
grep for "import" in routes/web.php and resources/js/Pages. For import screens outside your menu entries, only change the
import part (instructions, sample CSV, upload, history tabs), not the rest of that page.

For each screen (index, create, edit, show, import): take a screenshot, compare with the brief's standards and with the TNM
Mpamba equivalent (C:\xampp\htdocs\TNMMpamba - e.g. its Loan Book, Import History, Customers, Portfolios pages), fix what falls
short, rebuild, screenshot again. Priorities: no long scrolling pages (split into in-page tabs), proper tables with icon
actions, 15-row pagination with numbers, header with actions top right, plain labels, imports with instructions + "Download
sample CSV" (headers taken from the importer code) + upload + history. Remove spec references like "(spec v4 section 6.8)" from
visible text. The E-Banker Feed page (resources/js/Pages/Eir/Feed/Index.vue) is very long today (loads, build, periods built, a
query register of ~100 rows): split it into in-page tabs (e.g. Loads / Build / Periods built / Query register) and paginate the
long tables at 15.

Do not touch screens owned by others: Reports/** and Dashboard (reports agent), Settings (settings agent), EIR calculation/
rules/data screens and IFRS 9 model setup (model agent), ECL/admin/docs/workspace (admin agent). Do not change importer logic
or data, only the UI around it (a sample-CSV download route/controller method is fine if none exists; add the route line to
routes/web.php and keep it minimal).

Commit in logical chunks. Final report per the brief, including a one-line verdict per screen.
{
 "subagent_type": "general-purpose",

}
```

Tool call: Agent

```
description: Audit EIR and model screens
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md and follow it exactly. Your name for tools/screenshots: "model".

## Your scope (MAICC-IFRS9): audit and fix, end to end
Menu entries (see config/menu.php): EIR & Revenue Recognition (sections EIR Data: EIR Data / Drawdowns / Reference Rates; EIR
Rules: Accounting Rules / Fee Classification; EIR Calculations: Calculations / Coverage & Blockers; plus Governance Centre) and
IFRS 9 Model Setup (Staging & SICR Rules: Thresholds / SICR Groups / Alert Items / Trigger Alerts; PD Model: Transition
Profiles / Monthly / Cumulative / Internal Grades; LGD Model: Monthly / Cumulative; Forward-Looking Model: Macro Elements /
Weighted Forecast / Credit Loss Data / Adjusted Forecast / Correlation Finder / FLI Adjustments; Scenarios & Overlays: Scenario
Sets / Scenario Profiles / Manual Overlays / Economic Scenarios / External Calculations / Calculation History). Also their
create/edit/show/detail pages (e.g. EIR schedule show, transition matrix show, LGD detail, discounted payments).
NOT yours: EIR as at a Date and GL Reconciliation (reports agent), any import part of a page (data agent does imports - leave
import panels as they are), Reports/**, Settings, Dashboard, ECL Calculation, Mega Farm, admin screens.

For each screen: take a screenshot, compare with the brief's standards and with TNM Mpamba's equivalents (C:\xampp\htdocs\
TNMMpamba - its PD and LGD pages were overhauled: tabs, 15-row lists with page numbers, clear headers), fix what falls short,
rebuild, screenshot again. Priorities: no long scrolling pages (in-page tabs; e.g. the Coverage & Blockers page has a 50-row
"largest affected facilities" table that should be paginated at 15 or put behind its own tab), proper tables with icon actions
(view/edit/delete), header actions top right, plain English labels, consistent badges, empty states. Remove spec references
like "(spec v4 section 14.4)" from visible text. The Governance Centre is long; split it into tabs by setting area if it is not
already. Do not change engine logic, calculations or data; UI only. If a page throws an error, fix the UI cause or report the
server cause with file:line.

Commit in logical chunks. Final report per the brief, including a one-line verdict per screen.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Tool call: Agent

```
description: Audit ECL, admin, docs screens
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md and follow it exactly. Your name for tools/screenshots: "admin".

## Your scope (MAICC-IFRS9): audit and fix, end to end
Menu entries (see config/menu.php): Workspace (workspace.index), ECL Processing (ECL Calculation expected-credit-loss.index and
its create/show/projection pages; Mega Farm Programme megafarm.index), System Documentation (User Manual help.index,
Administrator Manual help.admin, Technical Manual docs.technical, Installation Guide docs.installation), Administration (Users
& Roles: Users / Roles & Permissions; Financial Periods; Audit: Audit Trail / Audit Trace / Compliance Audits; Support
Tickets). Also their create/edit/show pages, and the user Profile page (Jetstream profile.show).
NOT yours: Settings (settings agent), Dashboard and Reports (reports agent), imports (data agent), EIR and model setup screens
(model agent).

For each screen: take a screenshot, compare with the brief's standards and with TNM Mpamba's equivalents (C:\xampp\htdocs\
TNMMpamba - its ECL Calculation page with "Run ECL calculation" and exports top right, its Users/Roles and Audit Trail pages,
its manuals with a Download PDF button), fix what falls short, rebuild, screenshot again. Known problems: the Audit Trace page
is just an unstyled "contract id" box and the word "Trace" with an empty page - give it a proper search panel (labelled field,
green Trace button, empty state explaining what it shows) and well-formatted results. Priorities: no long scrolling pages
(in-page tabs), proper tables with icon actions, 15-row pagination with numbers, actions top right, plain English, empty states,
 staging basis shown on the ECL Calculation page if MAIIC records which basis a run used (TNM shows the PD/LGD method and
staging basis of a run; show what MAIIC actually stores, never invent it). Remove spec references like "(spec v4 section 12.5)"
from visible text. UI only; do not change engine logic or data.

Commit in logical chunks. Final report per the brief, including a one-line verdict per screen.

CLAUDE (2026-10-09 08:20:15 UTC)

All six agents are running. Pushing my two newest commits (full width, and the tabs and sidebar) to `eir_revenue_recognition`.

Tool call: Bash

```
description: Push latest commits to the working branch
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git fetch -q origin && git log --oneline origin/eir_revenue_recognition..HEAD && git push -q
origin HEAD:eir_revenue_recognition 2>&1 | tail -2; git status -sb | head -1
```

Result of Bash

```
4719d28 Tabbed sections and a TNM-style sidebar: Reports as one hub entry, related screens as tabs, coloured icons
8a0c4e2 Pages use the full width: the max-w and mx-auto page wrappers removed (dialogs keep their sizes)
## eir_revenue_recognition...origin/eir_revenue_recognition
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 08:20:47 UTC)

I've answered your questions, finished several changes, and the rest is being worked on in parallel.

Your database question. Port 8050 is running from `.env`, which now points to `maiic_ifrs9_demo`, your colleague's copy. It does have data: 6,732 loan-book rows from Dec 2024 to Aug 2026, 144 contracts and 31 solved EIRs. What it was missing is ECL for anything after Dec 2023. That's why the dashboard showed Dec 2023 with zero exposure.

Done and pushed to `eir_revenue_recognition` (no deploy). Refresh 8050 to see all of this:

- **Full width.** I removed the width cap from 59 pages, so nothing sits in a narrow centre column any more. Pop-up dialogs keep their sizes.
- **Related pages grouped under tabs.** The EIR group is down from 10 entries to 4 (EIR Data, EIR Rules, EIR Calculations, Governance Centre). Portfolio Setup, Collateral, Imports & Feeds, the PD, LGD and forward-looking model, Users & Roles, and Audit are each one entry now. The tab bar appears at the top of each screen in a section, and old links still work.
- **TNM-style sidebar.** Each group has a coloured icon and its name in normal case. Sub-items sit on a thin guide line with a gold marker on the page you're on. Reports is now one entry.
- **15 rows per page everywhere.** This covers 77 lists, all using one page-number bar with the current page in green.

Still running (six agents in parallel):

1. ECL for Jan to Aug 2026 on the demo database. It backs the database up to OneDrive first.
2. The Report Hub (every report inside it, like TNM), checking that each download is properly formatted, and a "Download dashboard (PDF)" button.
3. Settings: removing everything about Eswatini, credit scoring and other non-IFRS 9 items, checking whether TNM's staging basis applies to MAIIC, and formatted error and message boxes.
4. to 6. A screen-by-screen review in three batches. Each agent screenshots its screens, compares them with TNM and fixes them. Imports get instructions, a sample CSV download, an upload button and labelled tabs. Long pages get split into tabs, and edit and delete actions get proper icons. The empty Audit Trace page you showed is on the list.

The agents commit as they go, and I'll push their work to the same branch once I've checked each batch. The screen agents use their own server on port 8070, so your 8050 stays responsive. Your pages will change as each batch is built, so expect some movement while you're clicking around.

CLAUDE (2026-10-09 08:21:30 UTC)

ECL has now been run for every month from Jan to Aug 2026 on the demo database, using the system's own engines. Refresh the dashboard on 8050 and it should open on **Aug 2026**. The database was backed up to OneDrive first (`maiic_ifrs9_demo_pre-ecl_2026-10-09.sql.gz`).

Month	Loans	Carrying	ECL	Coverage
Jan 2026	123	17.86bn	5.29bn	28.2%
Apr 2026	127	18.91bn	7.25bn	36.2%
Aug 2026	135	23.32bn	10.52bn	42.7%

The August carrying amount matches the figure tied to the ledger (23,323,504,654). The results also agree within 0.05% with the clean bootstrap database for the months where both use the same basis.

To get a correct number, three stale parts of the demo database had to be refreshed first, using only the system's own seeders and build step:

- The loan books were built before a fix to the facility utilisation rate, which was stored as a percentage instead of a fraction. That inflated exposure to about 155bn on a 23bn book, so the books were rebuilt. Carrying amounts didn't change.
- Two missing governance settings were added: the stage cure period (3 months) and administrator override (not allowed).
- The PD profile was moved to grade on the measured stage, as audit finding M10 requires.

Before you present these figures:

1. **Coverage of 42.7% is high, and the Stage 1 PD for August is 44.95%.** That's what the engine produces from MAIIC's own default history. But a 45% one-year PD for performing loans is something Dr Thom will challenge. Treat it as a model finding to discuss, not a headline.
2. **All eight months are undiscounted and before the forward-looking adjustment.** The bootstrap database discounts at the locked EIRs and gets about 10.00bn for August.
3. **Everything is still labelled USD**, because the demo database's currency setting is USD and it has no MWK currency set up.
4. **Dec 2023 still appears in the month list.** It's an old run left in the data.
5. **Nov 2025 includes the Mega Farm book** (3,490 loans, 54.85bn). It didn't affect these results, but nobody should run a book-wide engine on that month without excluding those rows.

Two decisions for you:

- Should I put August on the discounted, forward-looking basis (about 10.0bn) for the meeting? It would then be on a different basis from the other seven months.
- Should I add MWK and switch the demo database's currency to it?

The Reports, Settings and three screen-review agents are still running.

System notification (2026-10-09 08:21:32 UTC)

USER (2026-10-09 08:23:13 UTC)

WHY ARE THE TABS NOT COLOURED AND WHY ARE THEY AT THE TOP OF THE PAGES HEADER, DONT U SEE HOW OTHER TABS ARE DONE IN OTHER PAGES MAKE SURW UR AGENTS DONT REPEAT THE SAME ERROR THEY SHOULD JUST ADD THESE THINGS WERE OTHER TABS ARE, IF THE TABS ARE NOE TOO MANY CREATE ANOTHER ONE AND NAME IT THEN OUT THOSE HEADERS WITH MEANING , L HAVE ONLY SHOWN U 2 PAGES BUT MAKE SURE ALL OF THEM ARE FIXED AND COUNT SHOWS THE ACTUAL NUMBERS IF TABS IUNDER EACH PAGE

CLAUDE (2026-10-09 08:23:26 UTC)

I see it. The section tabs I added are plain grey text above the title. Your other pages use a white panel below the title, with the active tab in green, a green underline and a count chip (like "Contract Master 144"). I'll make the section tabs match exactly: same style, below the page header, and each chip showing the real number of records behind that tab. First, telling the running agents so none of them repeats the mistake.

CLAUDE (2026-10-09 08:23:57 UTC)

The section tabs will use that exact markup, and the server will supply a real record count for each tab. To find what each tab lists, I'm working out which database table each tab's screen reads.

Tool call: Bash

```
description: Map each tab route to its controller and models
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php -r '
require "vendor/autoload.php"; $app=require "bootstrap/app.php"; $app->make(Illuminate\Contracts\Console\
Kernel::class)->bootstrap();
$tabs=[]; $walk=function($items) use (&$walk,&$tabs){ foreach($items as $i){ foreach($i["tabs"]??[] as $t) $tabs[]=$t["route"];
if(!empty($i["children"])) $walk($i["children"]); } }; $walk(config("menu.admin"));
foreach($tabs as $r){ $route=Route::getRoutes()->getByName($r); $a=$route->getActionName(); [$c,$m]=array_pad(explode("@",$a),2,
"__invoke");
 $src=""; try{ $rm=new ReflectionMethod($c,$m); $lines=file($rm->getFileName()); $src=implode("",array_slice($lines,
$rm->getStartLine()-1,$rm->getEndLine()-$rm->getStartLine()+1)); }catch(Throwable $e){}
 preg_match_all("/\b([A-Z][A-Za-z]+)::(query|where|with|orderBy|latest|select|count|paginate|all|whereIn|withCount|orderByDesc|
whereNull)\b/",$src,$mm); $models=array_values(array_unique(array_filter($mm[1],fn($x)=>!in_array($x,["DB","Inertia","Auth",
"Carbon","Route","Str","Arr","Cache","Gate","Schema","Log","Storage","Excel","Collection"])));
 $tbl=[]; foreach(array_slice($models,0,3) as $mo){ foreach(["App\\Models\\$mo","App\\Models\\FLI\\$mo"] as $fq){
if(class_exists($fq)){ $tbl[]=$mo."=".(new $fq)->getTable(); break; } } }
 echo str_pad($r,38)." ".basename(str_replace("\\","/",$c))."@$m  ".implode(", ",$tbl)."\n"; }'
```

Result of Bash

```

Section tabs in the in-page tab style, below the page header, with the real record count on each tab

The tab bar drawn from config/menu.php now uses the look of the in-page tabs (Eir/Data.vue): a white panel under the page
header, the active tab green with a green underline, and a chip with the number of records the tab's screen lists.
SectionTabCounts counts only the section the user is in, each table once a minute; analysis screens without a list show no chip.

cat >> "C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/tools/BRIEF.md" <<'EOF'

## Corrections from the user (added during the run - these override anything above)
8. TABS: every tab row must look like the existing in-page tabs on `resources/js/Pages/Eir/Data.vue` ("Contract Master 144 /
Cash Flows 1,296 ..."): white panel, active tab green text + green underline (`border-maiic-600 text-maiic-700`), a count chip
on each tab with the REAL number of records (`bg-maiic-100 text-maiic-800` on the active tab, `bg-gray-100 text-gray-600` on
others), placed BELOW the page header. Never plain grey tab text, never above the title. The layout already draws the section
tabs (from config/menu.php) in this style below the header - do not draw a second copy.
9. SUMMARY CARDS: any row of KPI/summary cards must be compact and fit on ONE line at 1440px: as many grid columns as cards
(e.g. `grid grid-cols-2 sm:grid-cols-3 lg:grid-cols-5` for 5), padding px-4 py-3, value text-xl/2xl bold, label text-[11px]
uppercase tracking-wider, sentence-case labels. One consistent style everywhere (`maiic-kpi` is fine).
EOF
echo ok
```

Result of Bash

```
ok
```

CLAUDE (2026-10-09 08:30:24 UTC)

I've fixed the tabs and pushed the fix; the smaller cards are with the agents and not done yet.

The tabs. They're now in the same style as your other tabs, which is what I should have used from the start. They sit below the page header in a white panel, with the active tab in green with a green underline and a chip showing the real number of records behind each tab. For example, EIR Calculations shows "Calculations 144" and "GL Reconciliation 1,564". Tabs for analysis screens with no list (Coverage & Blockers, EIR as at a Date) have no chip, so there are no made-up numbers. This applies automatically to every tabbed section in the menu. It's pushed as commit 3942322, so refresh 8050 to see it.

The summary cards. The EIR pages wrap five cards onto two rows. The agent that owns the EIR and model-setup screens is rewriting them as smaller cards on one line, across every page in those two groups. The other agents got the same rule for their pages, and both rules are now in the brief they all work from. That should stop the plain-tab mistake from coming back.

Still running: Reports, Settings and the three screen-review agents. I'll check and push their work as each one finishes. Two questions from earlier are still open:

- Should August's ECL be put on the discounted basis (about 10.0bn)?
- Should I add MWK as the currency on the demo database?

USER (2026-10-09 08:37:53 UTC)

THIS DOESNT LOOK NICE AT ALL , IN THE EIR TAB THE IMAGES SHOW HOW THE PAGES IN THE UI ARE LOOKING ITS NOT NCIE AT ALL AND LOKOKS RAW

SECONDLY LOOK AT THIS , WE HAVE 7 TABS THERE AND ITS WOLY SHOWING 3 , AND HOW DOW EHAVE OTHER 3 TABS AT THE TOP AND OTHER BELOW

<pasted_content id="88ea">

Contract Master 144

Cash Flows 1,296

Schedule Review 144

GL Reconciliation 1,564

</pasted_content id="88ea">

EIR Data 144

Drawdowns 0

Reference Rates 48

IF THEY ALL CNAT FOIT IN THE THE OPAGE ADD ANOTHER HEADER ON THE NAVIGATION OTHERWISE PUT ALL 7 OF THEM ACCORDING TO THE STEPS OG=F HOW ITS LOGGING, L DONT KNOW MAKE IT BETTER

CLAUDE (2026-10-09 08:38:41 UTC)

Two problems:

1. **EIR Data has two rows of tabs**: three section tabs on top and four page tabs underneath.
2. **Drawdowns and Reference Rates look raw**: unstyled tables, and buttons that look like plain text.

For the first, I'll merge everything into one row in the order the data comes in: Contract Master → Cash Flows → Drawdowns → Reference Rates → Schedule Review. "GL Reconciliation" also appears under EIR Calculations, so I'll keep it there only, where it belongs. Checking how the EIR Data page switches its tabs, and why those two pages look raw.

Tool call: Bash

```
description: Inspect EIR Data tab state and Drawdowns styling
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git log --oneline -3 -- resources/js/Pages/Eir/Data.vue resources/js/Pages/Eir/Drawdowns.vue

CLAUDE (2026-10-09 08:38:49 UTC)

The raw look has a clear cause. Those pages use generic class names (`th`, `td`, `secondary-btn`, `form-input`) instead of the `maiic-*` classes. Checking whether those names are defined anywhere.

Tool call: Bash

```
description: Find where th/td/btn classes are defined and used
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -E "^\s*\.(th|td|secondary-btn|primary-btn|form-input)\b" resources/css/*.css | head;
echo "--- pages defining them in <style>:"; grep -l -E "^\s*\.(th|td|secondary-btn|primary-btn|form-input)\s*\{" -r resources/
js/Pages | head; echo "--- pages using them:"; grep -rl -E 'class="(th|td|secondary-btn|primary-btn|form-input)[ "]' resources/
js/Pages | head -30
```

Result of Bash

CLAUDE (2026-10-09 08:39:57 UTC)

Now the EIR Data page itself has to stop drawing its own tab row. The agent that owns the EIR screens has unsaved edits in that file, so I'm giving it that change rather than editing alongside it.

Tool call: SendMessage

```
--- content ---
Coordinator change affecting resources/js/Pages/E…
{
 "to": "ab9fc5fd8c9688f5b",
 "summary": "Remove EIR Data in-page tab row",
 "message": "Coordinator change affecting resources/js/Pages/Eir/Data.vue (do this now, before other work): the user complained
the EIR Data screen showed two tab rows (section tabs EIR Data/Drawdowns/Reference Rates on top, page tabs Contract Master/Cash
Flows/Schedule Review/GL Reconciliation below). The layout now draws ONE row for the whole EIR Data section, in workflow order:
Contract Master (eir-data?tab=contracts) | Cash Flows (eir-data?tab=cashflows) | Drawdowns (eir-drawdowns) | Reference Rates
(eir-reference-rates) | Schedule Review (eir-data?tab=schedules), with real counts. GL Reconciliation lives under EIR
Calculations (eir-reconciliation) only.\nSo in Eir/Data.vue: (1) REMOVE the page's own tab nav block (the `<div class=\
"border-b border-gray-200 px-5 pt-4\"><nav class=\"flex gap-6 overflow-x-auto\">...tabs...</nav></div>`); keep the per-tab
title/description/search row and the tables, driven by the `activeTab` prop exactly as now (the server already reads ?tab=).
(2) Keep the 'gl' tab working if someone opens eir-data?tab=gl directly, but nothing needs to link to it. (3) The page title/
description should follow the active tab (e.g. \"Cash Flows\" with its description) rather than always \"EIR Data\". Also note:
I added global definitions for the shorthand classes .th, .td, .primary-btn, .secondary-btn, .danger-btn, .form-label, .badge-*
in resources/css/app.css (zebra rows, green header band) - many EIR/FLI/governance pages (Drawdowns, Reference Rates, AsAt,
Scenario Sets, etc.) used these classes without defining them and rendered raw. You can now delete the duplicated scoped
<style> copies in your pages if they match, and make sure every table in your scope sits inside a white rounded panel
(maiic-panel) with proper padding, as the user found Drawdowns and Reference Rates \"raw\". Commit Data.vue with your other
changes.",
 "type": "message",

scratchpad/tools/BRIEF.md" <<'EOF'
10. ONE TAB ROW PER PAGE. A page that belongs to a menu section (the layout draws the section tab row) must NOT draw a second
row of tabs. Merge its inner views into the section row instead, in workflow order, as tabs with params, e.g. `$tab('Cash
Flows', 'eir-data.index', 'eir.view', ['tab' => 'cashflows'])`. The page then reads the view from the URL (`?tab=...`, server
prop or `new URLSearchParams(location.search)`), defaults to the first view when none is given, hides its own tab nav, and may
send real counts for its views as an Inertia prop `tabCounts` keyed by the param value (e.g. `'tabCounts' => ['blockers' => 4,
'portfolios' => 2]`); the layout shows them in the chips. Examples already done: EIR Data (Contract Master | Cash Flows |
Drawdowns | Reference Rates | Schedule Review) and EIR Calculations (Calculations | Blockers | Coverage by Portfolio | Largest
Facilities | EIR as at a Date | GL Reconciliation). Keep a section row at 7 tabs or fewer; if more, report it so the
coordinator can split the section into another menu entry.
    You MAY now edit config/menu.php, but ONLY the $section entries of screens in your own scope, with small exact Edit-tool
edits (re-read the file first; other agents edit other entries). Run `php artisan test tests/Feature/NavigationTest.php` after
editing it.
11. LITTLE ABOVE THE TABLE. Before the first table a page may have only: the header (title, one-line description, actions top
right, and the filters if short - put period/portfolio selectors in the header actions or one compact filter bar), the tab row,
and ONE single-line strip of compact figures. Long explanations become a one-line muted caption or a collapsed "How this works"
disclosure (closed by default). Notices like "Covered facilities are disproportionately large" become one line, not a big box.
Progress bars/coverage gauges fold into the compact figure strip.

CLAUDE (2026-10-09 08:47:54 UTC)

Committing my side (one EIR Data row, shared table and button styles, page-supplied tab counts) before the agents start editing the menu.

Tool call: Bash

```
description: Commit and push tab merge and shared styles
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git add config/menu.php app/Support/SectionTabCounts.php resources/js/Jetstream/menuMatch.js
resources/js/Layouts/AppLayout.vue resources/css/app.css 2>/dev/null && git commit -q -F - <<'EOF'
One tab row per section: inner views join the section row; shared table and button styles defined once

A section tab may now open a view inside a screen (route plus params, e.g. eir-data.index with tab=cashflows), so a page's own
tabs merge into the section row instead of a second row under it. EIR Data runs in the order the data comes in (Contract Master,
 Cash Flows, Drawdowns, Reference Rates, Schedule Review) and EIR Calculations carries the three coverage views (Blockers,
Coverage by Portfolio, Largest Facilities). A page can send its own view counts as tabCounts. The shorthand classes th, td,
primary-btn, secondary-btn, danger-btn, form-label and badge-* are defined once in app.css: about thirty EIR, FLI, governance
and report screens used them without defining them and rendered as raw text.

IFRS 9 ECL reconciliation for the financial statements; dashboard ECL report PDF
ECL reconciliation (Reports hub, and the button on ECL Calculation):
- Rebuilt as the IFRS 7 note: (a) loss allowance reconciliation by stage
  (opening, transfers to stage 1/2/3, net remeasurement, new financial
  assets originated, financial assets derecognised, amounts written off,
  closing), (b) the same for the gross carrying amount, (c) exposure,
  allowance and coverage by stage with the prior year, (d) basis of
  measurement generated from the system's settings and applied PD/LGD.
- Fixes in the old report: transfers moved opening ECL out and closing ECL
  in, so they did not net to nil and hid remeasurement; it loaded every
  contract into PHP; months with no ECL showed zeros; write-offs were a
  silent 0 (the data has no write-off marker, now stated in the note).
- One source (EclReconciliationService::build, three grouped SQL queries,
  cached until either month changes) for the screen, PDF (statement
  style), Word (.docx built from OOXML, no new package) and Excel
  (TnmWorkbookBuilder; totals and checks are formulas).
- Units MWK, MWK '000 and MWK million with the system-to-AFS rounding
  block; every column must tie or the page turns red and downloads stop.
- Attribution is a pure function (EclMovementAttribution) with 11 unit
  tests. 2024-12 to 2025-12 Overdrafts ties to the saved ECL runs
  (572,095,272.84 to 896,597,080.09).

Dashboard: "Download ECL report (PDF)" for the selected month and
comparison month, using the same numbers as the dashboard (cover band,
headline figures, stage table, stage mix, 12-month SVG trend, basis).

Note: ReportsController and ExpectedCreditLossController changes for this
feature are committed with the export overhaul that follows (shared files).

Two new tasks from the user, both high priority:
A…
{
 "to": "ab37e55ea05be2487",
 "summary": "User: verify reports, add IFRS 7 note",
 "message": "Two new tasks from the user, both high priority:\nA) PROVE EVERY REPORT WORKS ON REAL DATA PER PERIOD. The demo DB
now has ECL for every month Jan-Aug 2026 (plus an old 2023-12). For every report in the hub (the ~31 catalogue reports in app/
Http/Controllers/Reports/Ifrs9ReportsController.php plus the screen reports), open it for 2026-08 AND 2026-07 (and download
each format it offers) and check: it loads without error, the figures come from the database for the chosen period (they change
between the two months and tie to the dashboard / expected_credit_loss totals where they should: e.g. Aug 2026 total ECL 10,
518m, EAD 24,639m, 135 loans; Jul 2026 ECL 9,070m), nothing is hardcoded or invented, empty sections say why. Fix what is
broken (UI or report query) - correctness beats looks; never fake a number. Produce a verification table in your final report:
report | loads | per-period OK | ties to | formats OK | fixed/issue.\nB) ADD THE ANNUAL-REPORT IFRS 9 NOTE, as TNM has it. In
TNM (C:\\xampp\\htdocs\\TNMMpamba, read-only) see commit bb8d1c7 \"IFRS 9 ECL reconciliation for the financial statements\":
EclReconciliationService::build, EclMovementAttribution (pure function, unit-tested), app/Services/Reports/
EclDisclosureDocuments.php, the PDF (statement style), Word .docx (OOXML, no new package) and Excel outputs; content = the IFRS
7 note: (a) loss allowance reconciliation by stage (opening, transfers to stage 1/2/3, net remeasurement, new financial assets
originated, financial assets derecognised, amounts written off, closing), (b) the same for the gross carrying amount, (c)
exposure, allowance and coverage by stage with the prior year, (d) basis of measurement generated from the system's settings
and the applied PD/LGD; units MWK / MWK '000 / MWK million with a rounding block; every column must tie or the page turns red
and downloads stop. Port this to MAIIC (MAIIC branding, MAIIC data model: loan_books.ifrs9stage_post_qualitative,
carrying_amount, expected_credit_loss by stage/period; write-offs only if MAIIC has a marker, otherwise state it in the note)
and make it THE \"IFRS 9 note for the annual financial statements\" report in the hub, replacing or absorbing the existing
fs-disclosure report. Add unit tests for the attribution as TNM did. Pick any two months (e.g. 2025-12 vs 2026-08 is not
possible for ECL - ECL exists Jan-Aug 2026, so default to the earliest and latest ECL months the user picks; allow Dec-year
comparisons when data exists).\nDo NOT yet merge or delete catalogue reports - the user is deciding on a consolidation plan;
keep routes intact.",

CLAUDE (2026-10-09 08:51:36 UTC)

Your three questions:

1. Audit Trail and Audit Trace do different jobs. Keep both.

- **Audit Trail** is the system-wide log of who did what and when: logins, records created or edited, approvals, with the old and new values. You filter it by user, date or module. It answers "what happened in the system?"
- **Audit Trace** follows one contract from oldest to newest: each version of its schedule, each rate reset or modification, each engine run that touched it, and the governance values each month ran under. It answers "how did this loan's EIR and ECL get to where they are?" That's what an auditor asks about a specific loan.

2. Do the reports work on real data for each period? I've asked the reports agent to prove it, report by report. It will open each one for Aug and Jul 2026, download every format, and check that the figures change with the period and tie back to the ECL totals. Anything broken gets fixed, with no made-up numbers. It will hand back a table showing the result for each report.

3. The annual-report IFRS 9 note, as TNM has it. It's being ported now. It covers:

- the loss allowance reconciliation by stage (opening, transfers, remeasurement, new loans, derecognised, written off, closing);
- the same reconciliation for the gross carrying amount;
- coverage against the prior year;
- the basis of measurement.

It comes as PDF, Word and Excel, in MWK, thousands or millions, and it blocks the download if any column fails to tie.

Do we need all 39 reports? No. Several answer the same question from slightly different angles. My recommendation is about 17 reports, with the merged ones becoming one report with sections, or sheets in the Excel version:

```
| Keep as one report | What merges into it |
|---|---|
| Executive summary | stays, with the AI commentary as its last section |
| ECL by stage | ECL summary by stage + Stage allocation + PD report |
| ECL by segment | Sector + Product group + Internal grade + Concentration + Cooperative links |
| Portfolio ECL trend | stays |
| Account-level ECL | stays (audit evidence) |
| Stage movement & SICR | SICR triggers + Stage migration |
| **IFRS 9 note (annual report)** | FS disclosure + ECL reconciliation + Stage-transition reconciliation + Gross movement + ECL
charge |
| Loan book reconciliation | stays |
| Model inputs | LGD & collateral + Agri risk cover + EAD |
| Forward-looking & scenarios | Macro scenarios + Scenario-weighted ECL |
| RBM return | stays (the regulatory return) |
| RBM classification & provisioning | RBM classification + IFRS 9 vs RBM + Provision comparison + NPL & arrears |
| EIR as at a date, GL reconciliation | stay |
| Stress testing, Early warning, Data quality | stay |
| Exports | Loan book export, ECL export, Disbursements, Auditor pack |
```

Nothing is deleted. The old addresses keep working and open the matching section of the merged report.

Tool call: AskUserQuestion

```
{
 "questions": [
  {
   "question": "Should I consolidate the 39 reports into about 17 as in the table above (merged reports become sections / Excel
sheets of one report)?",

   "multiSelect": false,
   "options": [
    {
     "label": "Yes, consolidate (Recommended)",
     "description": "About 17 reports in the hub; merged ones become sections/sheets; old addresses still work."
    },
    {
     "label": "Keep all 39",
     "description": "Leave the catalogue as it is; only fix and verify each report."
    },
    {
     "label": "Consolidate, but let me review",
     "description": "Build the merged versions but keep the old tiles visible until you've checked them."
    }
   ]
  },
  {
   "question": "The demo database labels all figures USD because its reporting currency is US Dollar and there is no MWK
currency at all. Add MWK and make it the reporting currency on the demo database?",
   "header": "Currency",
   "multiSelect": false,
   "options": [
    {
     "label": "Yes, add MWK",
     "description": "Create Malawi Kwacha (MWK) under Currencies and select it as the reporting currency on maiic_ifrs9_demo
only."
    },
    {
     "label": "No, leave it",
     "description": "Keep USD labels for now."
    }
   ]
  }
 ]
}
```

Result of AskUserQuestion

```
Your questions have been answered: "Should I consolidate the 39 reports into about 17 as in the table above (merged reports
become sections / Excel sheets of one report)?"="Yes, consolidate (Recommended)", "The demo database labels all figures USD
because its reporting currency is US Dollar and there is no MWK currency at all. Add MWK and make it the reporting currency on
the demo database?"="Yes, add MWK". You can now continue with these answers in mind.

CLAUDE (2026-10-09 08:52:49 UTC)

I've switched the currency to MWK and passed the report consolidation to the reports agent.

Currency. I added Malawi Kwacha (MWK) to the demo database and made it the reporting currency, so the dashboard and reports now say MWK instead of USD. I left the exchange-rate field empty rather than guess a figure. Refresh 8050 to see it. Only `maiic_ifrs9_demo` was touched.

Reports. The consolidation from 39 to about 17 is queued with the reports agent. It runs after two other jobs in this order:

1. Check every report against Jul and Aug 2026 data and fix what's broken.
2. Add the annual-report IFRS 9 note (PDF, Word and Excel, with tie-out checks).
3. Merge the reports into one report each with sections, and separate sheets in the Excel version.

The hub will then have a few tabs: Month-end ECL, Annual report & audit, Regulatory, EIR, Risk & analytics, Exports. Old report links keep working.

Settings is finished and pushed:

- One tabbed screen: Organisation, Reporting, Email, Staging basis and More settings.
- Everything for Eswatini, credit scoring, SMS, loan bands and billing is off the screen. I checked each item first, and none of the IFRS 9 or EIR engines read them.
- **Staging basis** applies to MAIIC, but as governed values. The tab shows the values in force (how days past due are counted, the Stage 3 trigger, the cure period, and the RBM thresholds) read-only, with a link to the Governance Centre. It isn't a second editable copy.
- Messages now appear as styled boxes: green for success, red for errors, amber for warnings. Delete confirmations use a styled dialog instead of the browser pop-up, and the screen agents are switching their pages over.
- **One data issue during testing:** a test save briefly changed the company name in the demo database to "MAII". It was put back to "MAIIC" straight away, and nothing else changed.
- **One thing to flag:** the "Quantitative Thresholds" tab under Staging & SICR edits an old table that the staging engine no longer reads, so it could mislead users. The agent that owns that screen is adding a one-line notice pointing to where staging is really set.

Still running: Reports and the three screen-review agents. Each change is pushed to `eir_revenue_recognition` as soon as I've checked it.

CLAUDE (2026-10-09 09:25:45 UTC)

All four agents are running again. The work they finished before the cut-off is pushed to `eir_revenue_recognition`: 10 commits.

What landed before the interruption:

- **Reports:**
  - The IFRS 9 note for the annual financial statements has been added.
  - The report catalogue is down from 39 to 17, in six groups in the hub.
  - The dashboard has a "Download dashboard (PDF)" button. It uses the same figures as the screen, and its EAD and weighted LGD now tie to the ECL runs.
- **EIR screens:** compact one-line figures, one tab row, 15-row lists, and icon buttons for actions.
- **Imports & Feeds:** one tab row, and import screens with instructions, a sample CSV, an upload button and history.
- **Portfolio Setup, Users & Roles, Financial Periods, Support Tickets:** reworked in the MAIIC style, with buttons top right.
- **ECL Calculation, Mega Farm, Audit Trail, Audit Trace and Compliance Audits:** reworked. Audit Trace now has a proper search panel and an explanation of what it shows.
- **Workspace, the four manuals and My Profile:** long scrolling pages removed.

What's still in progress:

- The agents left about 65 files half-edited when they were cut off. One of them, the Correlation Finder page, currently stops the system from building. Your 8050 site is unaffected because it's still serving the last good build. The newest changes will show there once the agents finish those files and the build passes. The EIR and model agent is fixing the Correlation Finder file first.
- **Reports:** the per-report check (Aug against Jul 2026, every format) and the final consolidation.
- **Customer & Loan Data:** Clients and Collateral.
- **The FLI, PD and LGD screens and the staging rules.**

I'll check each batch as it comes in, make sure the build passes, and push.

USER (2026-10-09 09:31:32 UTC)

IS THIS UPDATIG AS U GO

CLAUDE (2026-10-09 09:32:06 UTC)

Yes: the "System" steps are worked out live from the database for the selected month, so they update as the data changes. Manual steps (8 and 10) only change when an administrator ticks them. One line looks wrong, though: "PD model applied: 0 loans carry a PD". We ran the PD engine for August and LGD shows 135 loans, so I'm checking which column that step reads.

Tool call: Bash

```
description: Find the checklist step logic

Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 09:34:27 UTC)

Yes, it updates as the work goes on. Each "System" step is checked against the database every time you open the page, for the month in the selector (Aug 2026 here). Steps 8 and 10 are manual, so an administrator ticks them with the □ button.

Your screenshot caught a real bug. Step 4 said "0 loans carry a PD" for August, but the PD engine had applied a PD to all 135 loans. It stores that PD in a different place from the one the checklist was reading. I've fixed and pushed it, so refresh and step 4 should show **135 loans carry a PD** and turn Done, making it 6 of 10. The other steps showing as still to do are correct:

- **Forward-looking adjustment:** not run yet. The August ECL is on the basis before the forward-looking adjustment, as I mentioned earlier.
- **Stress scenarios:** none saved for August yet.
- **Review of reports and data quality, and management sign-off:** these are yours to tick.

The ECL and admin agent has also finished. Everything below is reworked and pushed:

- **ECL Calculation:** buttons top right, compact figures, and tabs with real counts.
- **Mega Farm and Workspace.**
- **Audit Trace:** a contract search with a list of all 144 contracts, a timeline and month-by-month view, both paged.
- **Audit Trail and Compliance Audits.**
- **Users, Roles and Financial Periods:** roles now use a grouped permission picker instead of 88 checkboxes.
- **Support Tickets:** status tabs with counts.
- **The four manuals:** they now open one chapter at a time with search, instead of one very long page.
- **My Profile.**

Still running: Reports (the per-report check against Jul and Aug, and the merge to 17), the customer and collateral screens, and the FLI, PD and LGD screens.

CLAUDE (2026-10-09 09:35:18 UTC)

The data agent has finished, but it reported something I need to look at straight away: the admin user is now getting "403 forbidden" on E-Banker Feed and Take-on Schedules. That would lock you out of those screens too. Checking the permissions.

Tool call: Bash

```
description: Check admin's roles and EIR permissions
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan tinker --execute='$u=App\Models\User::find(1); echo "roles:
".$u->getRoleNames()->implode(",")."\n"; foreach(["eir.view","eir.govern","eir.export","settings","reports.ifrs9","macro.view"]
as $p){ echo $p."=".($u->can($p)?"yes":"NO")."  "; } echo "\nperms total: ".$u->getAllPermissions()->count()."\n";' < /dev/null
2>&1 | tail -4; M="C:/xampp/mysql/bin/mysql.exe"; "$M" -uroot maiic_ifrs9_demo -e "SELECT r.id, r.name, COUNT(rp.permission_id)
perms, MAX(r.updated_at) upd FROM roles r LEFT JOIN role_has_permissions rp ON rp.role_id=r.id GROUP BY r.id; SELECT COUNT(*)
FROM permissions; SELECT id FROM permissions WHERE name='eir.view';"
```

Result of Bash

```
roles: admin
eir.view=NO  eir.govern=NO  eir.export=NO  settings=yes  reports.ifrs9=yes  macro.view=NO
perms total: 88
id    name    perms    upd

CLAUDE (2026-10-09 09:40:13 UTC)

The Loan Book now shows real PDs: Stage 3 at 100%, Stage 1 at 44.95%, Stage 2 at 30.48%. Coverage is now ECL over EAD, so 104420000003 shows 53.75% instead of 0%. Committing and pushing.

Tool call: Bash

```
description: Commit and push Loan Book fix
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git add resources/js/Pages/LoanBooks/Index.vue 2>/dev/null && git commit -q -m "Loan Book: PD
falls back to pd_prefli, the column the PD engine writes; coverage is ECL over the EAD shown beside it

Every loan showed a 0.00% PD because only pd_post_fli and pd_value were read, and an undrawn facility (no carrying amount)
showed 0% coverage against a real ECL.

Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>" && git fetch -q origin && git push -q origin
HEAD:eir_revenue_recognition 2>&1 | tail -1; git log --oneline -1
```

Result of Bash

```
1f694ef Loan Book: PD falls back to pd_prefli, the column the PD engine writes; coverage is ECL over the EAD shown beside it
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

Tool call: Agent

```
description: Finish remaining import screens
--- prompt ---
First read the shared brief: C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/
c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/tools/BRIEF.md (all of it, including the corrections at points 8-12) and follow
it exactly. Your name for tools/screenshots: "imports".

## Your scope (MAICC-IFRS9): the import parts of these screens only
The user's rule: every import must have a short "how to" instructions panel, a "Download sample CSV" button (a real CSV whose
headers are exactly what the importer reads - derive them from the importer/controller code, never guess), the upload button,
and an import history, with clearly labelled tabs or buttons. The data agent already did this for Imports, Loan Book, Clients
and Collateral; reuse its shared components in resources/js/Components/Data/ (InPageTabs.vue, LocalPager.vue,
ImportHistoryTable.vue) and copy its pattern (look at resources/js/Pages/LoanBooks/Import.vue and Clients/Import.vue, and the
`loan-book.sample` route for how a sample CSV is served).
Screens still missing it (find each upload/import UI with grep for "import", "upload", "type=\"file\"" in resources/js/Pages
and the matching routes in routes/web.php):
- EIR data intake (Eir/Intake.vue) and Drawdowns import
- Reference Rates import (Eir/ReferenceRates.vue)
- Credit Loss Data import (FLI/CreditLossData/*)
- Macro statistics / Macro Elements import (Macro/Index.vue, FLI/MacroStats/*)
- SICR groups and items uploads (StageingRules/*)
- Transition matrix and LGD uploads (TransitionMatrix/*, LossGivenDefault/*)
- External Calculations (FLI/ExternalCalculations/*)
- Trial balance import if there is a screen for it.
Only change the import part of each page (instructions panel, sample CSV, upload, history), keep the rest of the page as it is
(other agents already restyled it). Do not change importer logic or data. A sample-CSV route + controller method per importer
is fine (add the route lines to routes/web.php, minimal). Where an importer has no history table, show the general imports log
filtered to that import type if one exists, otherwise skip history and say so in your report.
Do NOT edit Reports/** or report controllers (the reports agent is working there). Build with TOOLS/build.sh, screenshot each
import screen before and after (save under TOOLS/shots/imports/), commit only your files in logical chunks, do not push. Final
report per the brief: one line per import screen.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Result of Agent

```
Async agent launched successfully. (This tool result is internal metadata — never quote or paste any part of it, including the
agentId below, into a user-facing reply.)
agentId: a3eac75d1dcb82f4d (internal ID - do not mention to user. Use SendMessage with to: 'a3eac75d1dcb82f4d', summary: '<5-10
word recap>' to continue this agent.)
The agent is working in the background. You will be notified automatically when it completes. You know nothing about its
results until that notification arrives — do not report, assume, or predict them; continue other work or respond to the user in
the meantime.
Do not duplicate this agent's work — avoid working with the same files or topics it is using.
output_file: C:\Users\DELL\AppData\Local\Temp\claude\c--xampp-htdocs-Stress-Testing-App\c9a0f915-2064-4f18-9b98-77857ef71421\
tasks\a3eac75d1dcb82f4d.output
Do NOT Read or tail this file via the shell tool — it is the full subagent JSONL transcript and reading it will overflow your
context. If the user asks for progress, say the agent is still running; you'll get a completion notification.
```

CLAUDE (2026-10-09 09:42:46 UTC)

Three more batches are pushed, and I fixed a permissions problem I had caused myself.

My mistake: the admin was locked out of the EIR screens. When I cleared the cache after adding MWK, the admin lost access to E-Banker Feed, Take-on Schedules, Macro Elements and other EIR screens. Those permissions had never been created in the demo database; they only worked earlier because the permission cache still held your own database's list. I ran the system's own permissions seeder on the demo database, and the admin now has all 94 permissions. If any page gave you "403 forbidden" in the last hour, refresh and it'll open.

Finished and pushed:

- **Customer & Loan Data:**
  - Clients, Loan Book and Collateral are reworked, and the client and collateral imports now have instructions, a sample CSV and history.
  - Several real bugs were fixed along the way. The loan-book sample CSV had the wrong headers. Client edit was wiping the sector. Portfolio search didn't work.
- **E-Banker Feed:** one tab row with real counts: Loads 2, Builds 3, Periods Built 26, Query Register 64, Take-on Blocks 100. The page went from about 8,600px tall to one screen.
- **EIR & IFRS 9 Model Setup:** every screen reworked.
  - Governance Centre is split into area tabs.
  - Coverage & Blockers now reads its view from the section tabs.
  - Transition Profiles was always empty because of a bug, and is fixed.
  - Browser pop-ups are replaced by styled dialogs.

Two more display bugs I found and fixed on the Loan Book:

- PD showed 0.00% on every loan. It now shows the real figure: 100% for Stage 3, 44.95% for Stage 1 and 30.48% for Stage 2.
- Undrawn facilities showed 0% coverage, because coverage was divided by the carrying amount (zero for undrawn facilities). It now divides by the EAD.

Model points to raise before the meeting. These aren't screen bugs:

1. **The Stage 2 PD (30.48%) is lower than the Stage 1 PD (44.95%).** That's backwards for an IFRS 9 model: performing loans shouldn't be riskier than loans with a significant increase in credit risk. It comes from MAIIC's own default history in the PD engine, so Dr Thom is likely to ask about it.
2. **Two different "exposure" figures.** The Loan Book card "Total EAD" (23.32bn) is the carrying amount, but the ECL engine's EAD is 24.64bn because it includes undrawn commitments. That's also why some Stage 3 loans show 53% coverage rather than the 59% LGD. I haven't changed this yet, because it decides which exposure figure the system presents.

Still running:

- Reports: checking every report against Jul and Aug, and the merge to 17.
- One new agent adding instructions, a sample CSV and history to the remaining import screens: EIR intake, Reference Rates, Credit Loss Data, Macro, SICR, transition matrix, LGD and External Calculations.

USER (2026-10-09 09:44:35 UTC)

LOOK AT THE MACRS STATIS PAGE , WE HAVE TABS ISSUES AGAIN and why is it not working was it dne end to end as other ifrs9 system do with fli , and then uopdates to the loanboos on the fli adj then we have the pd value wc is after fli , or is it name dpost fli pr pd value l dont know, was it build end to emd and to work

CLAUDE (2026-10-09 09:44:46 UTC)

Two separate problems:

1. **Tabs.** Macro Statistics draws its own five tabs under the Forward-Looking section row. Together that would be 11 tabs, too many for one row. Macro Statistics should be its own menu entry with its five tabs as the only row. Forward-Looking Model keeps its five, and Macro Elements moves out.
2. **Everything shows 0.** That's the bigger question: is the forward-looking chain built end to end? I'll check what the code does from macro data to the post-FLI PD on each loan, which column the ECL reads, and why the demo database is empty here.

Tool call: Bash

```

CLAUDE (2026-10-09 09:45:25 UTC)

I'll make Macro Statistics its own entry in IFRS 9 Model Setup, sitting before the Forward-Looking Model because it's the input. Its five views become the only tab row, with real counts.

Tool call: Bash

```
description: Read tab switching, controller render and menu entry
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -E "this\.tab\s*=|tab\s*=\s*'" resources/js/Pages/Macro/Index.vue | head; sed -n 46,
60p app/Http/Controllers/MacroStatisticsController.php; grep -n -B1 -A8 "Forward-Looking Model'" config/menu.php
```

Result of Bash

```
108:    select(s) { this.sel = s.id; this.tab = 'Data Entry'; this.go() },
        $sets =
DB::table('governed_scenario_sets')->orderByDesc('reporting_period')->orderByDesc('version')->limit(5)->get(['id',
'reporting_period', 'version', 'name', 'status']);

        return Inertia::render('Macro/Index', [
            'series' => $series, 'selected' => $selected, 'observations' => $observations, 'batches' => $batches, 'sets' =>
$sets,
            'canManage' => (bool) (auth()->user()?->canAny(['macro.manage', 'eir.govern']) ?? false), 'defaultCountry' =>
config('services.worldbank.country', 'MWI'),
        ]);
    }

    /** A preview from a source: World Bank (live), the IMF WEO file, or the RBM policy-rate file. Writes nothing. */
    public function preview(Request $request, WorldBankFetcherService $wb, ImfWeoParserService $imf)
    {
        $data = $request->validate(['source' => ['required', 'in:world_bank,imf_weo,rbm_file'], 'series_code' => ['nullable',

}
```

Result of AskUserQuestion

```
Your questions have been answered: "Should I run the forward-looking chain on the demo database (import the macro series, run
the Correlation Finder and regression fits, create the scenario set, apply the FLI route, re-run Jan-Aug 2026 ECL on the
post-FLI PD)?"="Run it and approve the best fit". You can now continue with these answers in mind.
```

CLAUDE (2026-10-09 09:48:24 UTC)

Approving the best fit, labelled "Demo, not a MAIIC approval". An agent will run the full chain on the demo database through the system's own services, backing the database up first.

Tool call: Agent

```
description: Run FLI chain on demo database
--- prompt ---
You are running the MAIIC IFRS 9 system's own forward-looking (FLI) chain on the DEMO database, so the forward-looking screens
and the ECL show real figures. The user approved approving the best fit for this demo.

## Context
- Laravel app at C:\xampp\htdocs\MAICC-IFRS9 (branch eir_revenue_recognition). `.env` points at `maiic_ifrs9_demo`. MariaDB:
`C:/xampp/mysql/bin/mysql.exe -uroot`. ONLY write to `maiic_ifrs9_demo`; you may READ `maiic_ifrs9_bootstrap` (it already ran
this chain) to compare.
- Demo state: loan books Dec 2024 to Aug 2026 (do NOT run book-wide engines on 2025-11: it also holds 3,490 Mega Farm rows), PD/
LGD/ECL already run for Jan-Aug 2026 on the pre-FLI basis (`ifrs9:recalculate-ecl p --level=portfolio --portfolio=1
--pd=pd_prefli`). Aug 2026 ECL today 10,517,469,001.95.
- Demo has NO macro data, NO fli_fits, NO governed scenario sets. Bootstrap has 13 macro series / 261 data points, 209 fits (0
approved), 1 scenario set, pd_post_fli on the Aug loans with fli_adj 0.
- The chain in code: app/Console/Commands/Bootstrap.php (read stepEngines and the FLI part around lines 220-360:
`macro:import-worldbank`, ScenarioSetService create/approve with BOOTSTRAP_LABEL, `fli:correlate`, FliRouteService applied once
per scenario, then ECL with --pd=pd_post_fli, sensitivity). Also read docs/After_Build_Report_2026-10-08.md. Columns: pd_prefli
(PD before FLI), pd_post_fli (after FLI, written by FliRouteService with fli_adj, fli_route, fli_method, fli_fit_id,
fli_set_id), pd_value is legacy.

## Steps
1. Backup first: `C:/xampp/mysql/bin/mysqldump.exe -uroot --single-transaction --routines --triggers maiic_ifrs9_demo | gzip >
"C:/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project Execution/Database Backups/maiic_ifrs9_demo_pre-fli_2026-10-09.sql.gz"`;
confirm size.
2. Macro data: run the system's import (`macro:import-worldbank` as the bootstrap does; if the internet is unavailable use the
offline snapshot the system ships with - see the macro statistics commit 0c4d748 "offline snapshot").
3. Run the chain exactly as the bootstrap does for the demo's periods (Jan-Aug 2026 reporting months): correlation finder,
regression fits, scenario set created and approved (use the system's ScenarioSetService; label it like the bootstrap), then the
FLI route per scenario.
4. APPROVE THE BEST FIT: use the system's own fit approval flow (maker-checker, FliFit approval service/controller). Pick the
fit the system's guardrail ranks best (passes the guardrail, correct expected sign - see fli_expected_sign_test, highest
ranking). Record the approval with the label/note "Demo, not a MAIIC approval". Do NOT bypass maker-checker with direct SQL. If
maker-checker requires two different users and the demo has only one, you may create ONE extra demo user named "Demo Approver
(not MAIIC)" with email demo.approver@maiic.local and a random strong password (not reported), give it only the roles/
permissions needed to approve, and use it as the checker. If the governance setting maker_checker_admin_override blocks
something, do not change governance settings - report it.
5. Re-run the FLI route with the approved fit and re-run ECL for Jan-Aug 2026 with `--pd=pd_post_fli` (same level/portfolio as
before), so every month is on the same post-FLI basis. Make sure `reporting_periods.ecl_calculated` stays set and the Workspace
"Forward-looking adjustment applied" step would read done (loans with pd_post_fli).
6. Correctness rules: never hardcode or invent figures; if a step cannot run on real data, fail closed and report the exact
blocker with file:line. Do NOT edit repo code (report bugs instead). Do not commit anything.

## Report back (concise)
Backup path/size; macro series and data points loaded; the approved fit (series, lag, coefficient, R2 / guardrail verdict) and
who proposed/approved; scenario set weights; per month Jan-Aug 2026: pre-FLI ECL, post-FLI ECL, average fli_adj, coverage; any
blocker; anything a meeting audience would question (e.g. sign or size of the adjustment).
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Result of Agent

```
Async agent launched successfully. (This tool result is internal metadata — never quote or paste any part of it, including the
agentId below, into a user-facing reply.)
agentId: ad6c9ad8998fbcc42 (internal ID - do not mention to user. Use SendMessage with to: 'ad6c9ad8998fbcc42', summary: '<5-10
word recap>' to continue this agent.)
The agent is working in the background. You will be notified automatically when it completes. You know nothing about its
results until that notification arrives — do not report, assume, or predict them; continue other work or respond to the user in
the meantime.
Do not duplicate this agent's work — avoid working with the same files or topics it is using.
output_file: C:\Users\DELL\AppData\Local\Temp\claude\c--xampp-htdocs-Stress-Testing-App\c9a0f915-2064-4f18-9b98-77857ef71421\
tasks\ad6c9ad8998fbcc42.output
Do NOT Read or tail this file via the shell tool — it is the full subagent JSONL transcript and reading it will overflow your
context. If the user asks for progress, say the agent is still running; you'll get a completion notification.
```

CLAUDE (2026-10-09 09:48:47 UTC)

The forward-looking chain is now running on the demo database, and the best fit will be approved as you chose. Nothing from it has come back yet.

What it does:

1. Backs up the demo database to OneDrive first.
2. Imports the macro series. It uses the copy saved in the system if it can't reach the internet.
3. Runs the Correlation Finder and the regression fits.
4. Approves the fit the system's own checks rank best, under the label **"Demo, not a MAIIC approval"**. It goes through the system's own maker-checker step, not a direct database edit. If that step needs a second person, it may create one extra user called "Demo Approver (not MAIIC)" as the checker.
5. Creates and approves the scenario set, then applies the adjustment to every loan.
6. Re-runs ECL for Jan to Aug 2026 on the post-FLI PD, so all eight months are on the same basis.

When it finishes you'll get the approved fit (which series, at what lag, and the guardrail's verdict), the scenario weights, and ECL before and after the adjustment for each month. That way you can see how much the adjustment moves the numbers before Dr Thom does.

Still running alongside it: the agent adding instructions, a sample CSV and history to the remaining import screens. Everything else is done and pushed to `eir_revenue_recognition`.

USER (2026-10-09 09:54:11 UTC)

do all the pages under sceanrio and overlay , all the tabs ui and the fli for foward looking information look nice to u , how do other banks so it, how do we improve ourprocesses so that they are easy for all users and it works asifrs9 stipulates and what other banks in africa are doing what do u thin we should do

CLAUDE (2026-10-09 09:54:48 UTC)

I'll look at the screens themselves before giving an opinion. Screenshotting all 11 tabs across Forward-Looking Model and Scenarios & Overlays. The forward-looking chain is filling the demo database right now, so some may still be empty.

Tool call: Bash

```
description: Resolve URLs of the FLI and scenario tabs
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && for r in macro-forecast-weighted.index credit-loss-data.index forecasting.manual

CLAUDE (2026-10-09 09:57:50 UTC)

I've gone through all 11 screens. My verdict: **no, they're not all good yet.** The engine behind them is better than the screens make it look. Here's my view on each part.

The screens: what's good and what's not

Worth keeping as they are:

- **Scenario Sets** is the best screen in the module. The scenarios are anchored to real Malawian events: the downside to the November 2023 devaluation, when the kwacha fell 44%, and the severe case to the 2016 El Niño drought plus devaluation. The weights are 50/15/25/10, and there's a sensitivity table showing ECL at 100% of each scenario. That's exactly what an auditor asks for. Layout fixes needed: the description column is squeezed into a narrow strip, the paths table says "BASE" twice, and the downside column is cut off.

Need work:

- **Regression (FLI Adjustments)**: all 100 fits sit in one table about 4,000px tall. The approval column falls off the right edge, and the approved fit (#143) is buried in 9th place.
- **Correlation Finder**: the "Reason" column is raw engine output, like `[recommended]; correct sign (positive); R2 0.735>=0.30; p=0.000<=0.05`.... A finance user can't read that. Series appear as codes like `NPL_RATIO_MAIIC_AGRICULTURA`, cut off mid-word.
- **Adjusted Forecast and External Calculations** are old tools from the platform this system was copied from. Their forms come pre-filled with made-up numbers (intercept 0.02, coefficient 0.3, NPL 11.55, inflation 31.5…), which is risky. External Calculations is already marked "retired".
- **The biggest problem is that there are two forward-looking processes side by side.** The governed one runs Correlation → Regression → Scenario Sets → Overlays → applied to every loan. The legacy one is Weighted Forecast, Credit Loss Data, Adjusted Forecast, Economic Scenarios, Scenario Profiles, External Calculations and Calculation History. A user can't tell which one produces the ECL. Only the governed one does.

What IFRS 9 requires

ECL has to be an unbiased, probability-weighted amount. It must use reasonable and supportable forward-looking information, without undue cost. It needs more than one scenario where losses respond non-linearly (IFRS 9 5.5.17 and B5.5.42). Adjustments after the model are allowed, provided they're governed, documented and disclosed. MAIIC's design meets this on paper:

- several weighted scenarios;
- maker-checker on the fit and the scenario set;
- an overlay register with an owner and an expiry date;
- each loan records which fit and which scenario set produced its PD.

What other African banks do

These are general patterns, not checked against particular banks' reports:

- **The large South African banks** run three to five scenarios (base, upside, downside, often a severe one), produced by in-house economists. A credit or economics committee sets the weights. Satellite models link GDP, inflation, interest rates and the exchange rate to PD, often through a credit-cycle (Vasicek / Z-factor) shift. Management overlays are disclosed separately: COVID, load-shedding and floods in recent years.
- **Banks in Kenya, Nigeria, Ghana and Malawi with thinner data** usually regress the industry NPL ratio on a few macro drivers, using IMF WEO forecasts, and apply the result as a scalar on PD. Heavy, documented judgement overlays are common because history is short.
- **Development finance institutions** like MAIIC often lack enough of their own defaults to fit a model. They borrow sector or sovereign default studies and use a credit-cycle shift. Board-approved weights and overlays carry much of the weight.

Where MAIIC's model is weak, and what Dr Thom may ask

1. **The fits use 14 to 26 monthly points, all from July 2024 onwards.** That's too little history for a credible regression, and most fits regress MAIIC's own Stage 3 share. That share partly reflects MAIIC's own staging rules, not just the economy.
2. **No check for spurious trends.** Two series rising together over two years will always look correlated. The guardrail tests the sign, R^2 and p-value, but not stationarity.
3. **The approved fit links the PLR to the Stage 3 share at a 9-month lag.** It's plausible: higher rates lead to more defaults. But the PLR follows RBM policy, so it overlaps with inflation and the exchange rate.

What I'd recommend

1. **Give the forward-looking process one guided path, with three cadences:**
   - Once a year: approve the model (choose the drivers and approve the fit, using a validation pack).
   - Once a quarter: approve the scenarios and weights. In practice that's ALCO or the economist.
   - Every month: the system applies everything automatically and shows the impact.

Each step gets a status ("approved 12 Mar, valid to Mar 2027"), so a month-end user never touches a regression.

2. **Move the seven legacy screens out of the menu** into a hidden "Legacy tools" area. The menu then shows four entries: Macro Statistics, Drivers & Model, Scenarios & Weights, Overlays.
3. **Make results readable:**
   - Replace the reason text with plain sentences, like "Inflation explains 74% of the movement in agricultural NPLs, 6 months later".
   - Show a chart of the driver against the loss measure.
   - Put the approved fit at the top, page the fits table at 15, and use full series names.
4. **Show an impact waterfall on the ECL page:** pre-FLI ECL → forward-looking effect → overlays → final ECL. That's the line auditors and the board look for, and it feeds the IFRS 9 note.
5. **Strengthen the model itself:**
   - Fit on industry or RBM sector NPL data with a longer history, not just MAIIC's own two years.
   - Add a stationarity check (or fit on changes, not levels) to the guardrail.
   - Offer the credit-cycle Z-shift as the standard method while MAIIC's own default history is short.
   - Re-test the model against what actually happened every year.

Before the meeting, the screen fixes in points 2 and 3 are the quick wins, roughly an hour of work. The guided path in point 1 is a bigger build. The model changes in point 5 are methodology decisions to agree with Dr Thom first.

Should I start with the quick screen fixes now? The forward-looking chain is still running on the demo database. The screens already show the approved fit (#143) and the average PD moving from 63.88% to 66.06%. I'll give you the full before-and-after ECL by month when it finishes.

CLAUDE (2026-10-09 09:58:09 UTC)

The forward-looking chain has run end to end on the demo database, with the best fit approved as you chose. Every month from Jan to Aug 2026 now has a post-FLI PD on every loan and an ECL recalculated on it. The database was backed up to OneDrive first (`maiic_ifrs9_demo_pre-fli_2026-10-09.sql.gz`).

Month	ECL before FLI	ECL after FLI	Change	Coverage before → after
Jan 2026	5,290m	5,459m	+3.2%	29.6% → 30.6%
Apr 2026	7,249m	7,512m	+3.6%	38.3% → 39.7%
Jul 2026	9,070m	9,310m	+2.6%	42.2% → 43.3%
Aug 2026	**10,517m**	**10,808m**	**+2.8%**	**45.1% → 46.3%**

How it was set up:

- **The approved fit:** the prime lending rate (PLR) drives the Stage 3 share 9 months later. R^2 is 0.74, the sign is right (higher rates, more defaults) and it passes the guardrail, but it rests on only 26 monthly points. The run used the rule the system itself used to pick fits before: the best fit that covers the whole book, not a single segment.
- **The approval:** proposed by Admin and approved by a second user, **"Demo Approver (not MAIIC)"**. That user was created only for this, holds a single permission and no role, and its password wasn't recorded anywhere. Every approval is labelled "Demo, not a MAIIC approval".
- **Scenario weights:** base 50%, upside 15%, downside 25%, severe 10%. Together they add about 8.8% to Stage 1 and Stage 2 PDs. Stage 3 loans stay at a 100% PD, so the adjustment doesn't change them.

A real engine bug came out of this, and it matters for IFRS 9:

- **Jan to Jul use information from after their own reporting dates.** The correlation, the regression and the scenario's base PLR all read the latest data available, not the data as at that month. Jan 2026 was measured from August's PLR of 20.8%, when January's actual PLR was 25.3%. IFRS 9 requires information available at the reporting date, so **only August is on a correct basis**. Nothing in the code was changed; this needs a fix.
- **The 9-month lag isn't applied.** The adjustment uses the scenario's first-year PLR straight away.
- **Smaller points:**
  - The base scenario adds nothing, even though the PLR is falling.
  - The scenario sensitivity's weighted ECL is about 0.2% below the booked ECL.
  - The fit hangs mostly on a single PLR jump in March 2024, from 17.3% to 24.9%.

For the meeting: present August's figures (ECL 10.81bn, coverage 46.3%) as the forward-looking result, and treat Jan to Jul as illustrative until the bug is fixed. The bigger question for Dr Thom is still the size of the base PDs: Stage 1 PDs of 20% to 45% drive coverage above 40% before the forward-looking adjustment adds anything.

Here's what I'd do next, in order:

1. **Fix the as-at-date bug:** cut every series off at the reporting month, take the base PLR as at the month, and apply the lag. Then re-run Jan to Jul so all eight months are on a correct basis.
2. **The quick screen fixes:** move the seven legacy screens out of the menu, translate the correlation reasons into plain sentences, put the approved fit first and page it at 15, and fix the Scenario Sets layout.
3. **Later, with Dr Thom's agreement:** the guided annual / quarterly / monthly process and the stronger model (industry NPL data, stationarity check, credit-cycle shift).

Shall I go ahead with 1 and 2?

USER, sent while Claude was working (2026-10-09 09:59:16 UTC)

in the loan book table tt shos in the ui , can we write the columns to show pd prefli, its shows the fli adh then pd after prefli same with lgd if they have anything like that or of they are fefcted by that, ould also show the eir for each client calculated etc, what ther things do u think a loanbook should shhow at a glance in the ui or is those columns better psositioned in the ecl tabele where we will now claculate ecl and how does some of these show on the dahsbaord , u can hep me then we design the best possible design

push chnages as we go , and give me a rundown when done d all the comands the client should run and gow the system is working , so do we onky have 1 portfolio for maic and zero products and just 8 sectors , are thiose sectors being used anyways in the reports o showing their pd results by sector as oitputs and as per their classes as requested by the RBM

also do these

Tool call: Agent

```
description: Fix FLI as-at-date engine bug
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md (Git, DB and tools rules apply; you are "fli-engine"). You fix an IFRS 9 correctness bug in the forward-looking
(FLI) ENGINE of MAICC-IFRS9 (C:\xampp\htdocs\MAICC-IFRS9, branch eir_revenue_recognition), then re-run the chain on the demo
DB. Do NOT edit any Vue page (another agent is restyling the FLI screens right now); engine/services/commands/tests only.

## The bug (found when the chain ran on maiic_ifrs9_demo for Jan-Aug 2026)
1. LOOK-AHEAD: the correlation sweep and the regression read every macro and proxy series without cutting it off at the
reporting month (app/.../CorrelationFinder.php around lines 74-75, RegressionEngine.php around 58-59), so every month Jan-Jul
2026 got the identical fits computed with data up to Aug 2026. IFRS 9 requires information reasonably available at the
reporting date: a run for period P must only use observations dated on or before the end of P (and macro forecasts published by
then - if the data carries a vintage/fetched date use it, otherwise at least the observation date).
2. The route's base value (e.g. PLR) is the latest value overall, not the latest up to P (FliRouteService.php around line 104;
ScenarioSetService.php around 399-400 for the scenario paths). Jan 2026 was measured from Aug's PLR 20.8 while Jan's actual PLR
was 25.3.
3. The fitted LAG is not applied: the route uses the scenario's first-year driver value straight away. With a lag L months, the
PD at P should respond to the driver at P-L (for the historical part) / the scenario path L months ahead of the base - work out
the correct, documented treatment from the code's own design (read docs/ spec v4 sections 14.x on the transmission method and
the After_Build_Report) and implement it consistently; if the spec is silent, choose the treatment that is defensible under
IFRS 9 B5.5.42-B5.5.54, document it in a code comment and in your report.
4. Minor: the scenario sensitivity's weighted ECL is ~0.17% below the booked post-FLI allowance (Aug 10,789.3m vs 10,808.1m) -
find why and make them reconcile, or explain precisely why they legitimately differ.
Correctness rules: never hardcode, never proxy/fallback silently, fail closed with a clear reason if a period lacks the data.
Write unit/feature tests that prove a period never sees data after its end (e.g. a fixture where a later observation would
change the fit) and that the base value is as at the period. Run the existing FLI/Regression/Scenario tests (tests/Feature/FLI,
tests/Feature/Regression, scenario tests) and keep them green.

## Then re-run on maiic_ifrs9_demo (only that DB)
Backup first to "C:/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project Execution/Database Backups/
maiic_ifrs9_demo_pre-fli-fix_2026-10-09.sql.gz". Current state: fits approved per month (Aug fit 143 PLR->STAGE3_SHARE lag 9;
Jan-Jul fits 352,561,770,979,1188,1397,1606) via FliRouteService::proposeFit by Admin (user 1) and approveFit by user 2 "Demo
Approver (not MAIIC)" with label "Demo, not a MAIIC approval"; scenario sets ids 1-8 approved; ECL Jan-Aug run with
`ifrs9:recalculate-ecl P --level=portfolio --portfolio=1 --pd=pd_post_fli`. After the fix, re-run for each month Jan-Aug 2026:
correlation sweep + fits as at P, re-approve the equivalent fit for each month through the same maker-checker flow and label
(the same driver/proxy/lag choice rule: best applied fit on a book-level proxy, ranked by R2 then n; if a month's as-at data no
longer supports any applied fit, fail closed for that month and report it - do not force one), route, ECL with --pd=pd_post_fli,
 scenario sensitivity. Do not run book-wide engines on 2025-11.
Commit your code + tests (own files only; do not push). Report: the code changes (file:line), the lag treatment chosen and why,
tests added and results, and a per-month table pre-FLI ECL / post-FLI ECL / change / approved fit (driver, lag, R2, n) / base
driver value as at the month, plus anything an auditor would question.

 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Tool call: Agent

```
description: FLI screens quick fixes
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md fully (points 1-12 apply; you are "fli-ui"). Scope: the forward-looking (FLI) and scenario SCREENS of
MAICC-IFRS9. Do NOT edit engine services (app/Services/Fli/*, app/Services/Scenario/*, CorrelationFinder, RegressionEngine,
commands) - another agent is fixing an engine bug there right now; presentation in controllers (shaping props) and Vue pages
only.

Tasks (the user approved these):
1. LEGACY SCREENS OUT OF THE MENU. Two forward-looking processes sit side by side and confuse users. The governed one (Macro
Statistics -> Correlation Finder -> Regression (FLI Adjustments) -> Scenario Sets -> Manual Overlays -> applied to every loan)
produces the ECL. The legacy ones do not: Weighted Forecast (macro-forecast-weighted.index), Credit Loss Data
(credit-loss-data.index), Adjusted Forecast (forecasting.manual), Scenario Profiles (scenarios.profiles), Economic Scenarios
(fli.scenarios.index), External Calculations (fli.external.index), Calculation History (fli.external.list). First CHECK in code
whether any of them feeds the governed chain or the ECL (grep their tables: macro_credit_loss_data, macro_forecast_weighted,
scenario_profiles, scenario_sets, fli_adj, fli_reporting_periods_parameters). Credit Loss Data in particular may be an input
(credit-loss proxies) - if a screen is a real input of the governed chain, keep it. Then edit config/menu.php (you may, small
exact edits; re-read first): Forward-Looking Model becomes the governed steps in order (e.g. Correlation Finder | Regression
(FLI Adjustments) [| Credit Loss Data if it is an input]); Scenarios & Overlays becomes Scenario Sets | Manual Overlays; the
legacy screens go into ONE new Administration entry "Legacy FLI tools" (a section with those tabs) so they stay reachable, each
page showing a one-line notice "Legacy tool, not used by the ECL: the forward-looking adjustment is set on Regression (FLI
Adjustments) and Scenario Sets". Update tests/Feature/NavigationTest.php if needed and run it.
2. CORRELATION FINDER readable: replace the raw "Reason" text (e.g. "[recommended]; correct sign (positive); R2 0.735>=0.30;
p=0.000<=0.05; 24 obs 202407-202606; Pearson+Spearman agree; best lag 6m; forecastable (IMF WEO); spans MAIIC_EBANKER_TAKEON;
method=pearson") with a plain sentence built from the same fields, e.g. "Inflation explains 74% of the movement in MAIIC
agricultural NPLs, 6 months later (24 months of data, Jul 2024 to Jun 2026). Sign as expected." with the technical detail
available on hover or an expandable row. Show full human names for series and proxies (derive from the macro series / proxy
definitions, never truncate mid-word; e.g. NPL_RATIO_MAIIC_AGRICULTURA -> "NPL ratio, MAIIC agricultural loans").
3. REGRESSION (FLI Adjustments): the approved fit pinned at the top as a highlighted card (driver, proxy, lag, slope, R2, n,
approved by/when, label), the fits table paginated at 15 (applied first, then declined), no column cut off (approval column
visible), the long sections behind closed disclosures, plain names as in 2.
4. SCENARIO SETS layout: the scenario description column is squeezed into a narrow strip - give scenarios a readable card/row
layout; fix the duplicated "BASE" header in the paths table and the cut-off Downside/Severe columns; keep the sensitivity table.
5. Pages must follow BRIEF rule 10 (one tab row) and 11 (little above the table).
Build with TOOLS/build.sh, screenshot before/after (TOOLS/shots/fli-ui/), commit own files in logical chunks (do not push).
Final report: one line per screen, what moved in the menu and why, and anything you found feeding the ECL that you kept.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Tool call: Agent

```
description: Loan book, ECL table, dashboard design
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md fully (points 1-12 apply; you are "book"). Scope: Loan Book page (resources/js/Pages/LoanBooks/Index.vue +
LoanBookController), ECL Calculation page (resources/js/Pages/ExpectedCreditLoss/Index.vue + ExpectedCreditLossController index
props), Dashboard (resources/js/Pages/Dashboard.vue + DashboardController). Do not edit FLI pages or engine services (other
agents are working there).

The user asked: show for each loan the PD before FLI, the FLI adjustment, the PD after FLI, the LGD (and any LGD before/after
if the system has such a split), and the EIR calculated for each contract; decide what a loan book should show at a glance
versus what belongs in the ECL table; and how this shows on the dashboard. Design and build this:
- Columns in loan_books (demo DB maiic_ifrs9_demo, period 2026-08): pd_prefli (PD from the PD engine), fli_adj (relative
adjustment, post/pre - 1), pd_post_fli (PD after FLI), fli_route/fli_method/fli_fit_id/fli_set_id (lineage), lgd_value, ead,
carrying_amount, commitments, facility_utilisation_rate, ecl_value, ifrs9stage_post_qualitative, days overdue fields,
product_group/product_code, industry_type/industry_code, loan_portfolio_id. pd_value is LEGACY (not used by the engines) -
never show it as the PD. The locked EIR per contract lives in contract_eir (join on contract id; check the column names and the
EIR status: only show a locked/approved EIR, else show the status, e.g. "Pending"). Check for an LGD before/after split in the
schema; if none, show one LGD.
- Recommended split (implement unless the code shows a better fit): LOAN BOOK = "what the book is": contract, customer, product
group, sector, stage badge, days past due, RBM class if derivable from the system's existing RBM classification logic (reuse it,
 don't reinvent), carrying amount, undrawn commitment, EAD, EIR (locked), ECL and coverage; with a row expander (or a side
panel) showing the loan's full IFRS 9 lineage: PD pre-FLI -> FLI adjustment % -> PD post-FLI, LGD, EAD build-up (carrying +
undrawn x utilisation), ECL, the fit/scenario set it ran under, and a link to Audit Trace for the contract. ECL CALCULATION
TABLE = "how the ECL was built": EAD, PD pre-FLI, FLI adj %, PD post-FLI, LGD, ECL (undiscounted/discounted as the page already
distinguishes), coverage, with a total row; filters by stage, product group, sector. Keep 15 rows a page, compact one-line
figure strip, actions top right (BRIEF rules).
- DASHBOARD: add an "ECL build-up" panel: pre-FLI ECL -> forward-looking effect -> manual overlays (from the overlay register,
0 if none) -> final ECL for the selected period, computed from the saved data (pre-FLI ECL = sum over loans of EAD x pd_prefli
x LGD on the same basis as the engine - verify it ties to the booked ECL when FLI is zero; if the system stores a pre-FLI run,
use it; never invent). Also a small "ECL by product group" and "ECL by sector" breakdown (top 6, rest grouped) and, if the RBM
classification is available, ECL/exposure by RBM class. Must tie to the dashboard totals. Add these to the dashboard PDF too if
DashboardController::eclReportPdf builds from dashboardState (keep them in step).
Verify figures for 2026-08 against the DB (post-FLI ECL 10,808,070,276.66, pre-FLI 10,517,469,001.95 - note another agent may
re-run the FLI chain on the demo DB while you work; re-read figures at the end and make sure your page always computes from the
DB, never from these numbers). Build with TOOLS/build.sh, screenshot (TOOLS/shots/book/), commit own files in logical chunks,
do not push. Final report: the design decisions, the columns on each screen, what the dashboard shows, ties checked.

```

Result of Bash

```
compliance:audits | Load the compliance register from the workbooks, export the signed state, build the auditor's pack for a
period
eir:as-at | Show the EIR computation for a loan, or the book, as at any date: amortised cost, gross, EIR and contractual
interest to the date, the difference
eir:baselines | Run the acceptance ties and golden numbers against the database
eir:bootstrap | Clean install: seed, land the committed client inputs, build, run the engines, verify the golden numbers
eir:build-loan-books | Build loan_books for a range of months from the landing zone by method A, B or C, under maker-checker
eir:derive-spreads | Derive each contract's spread over the reference rate from the loan books and flag any that drifts
eir:generate-schedules | Generate draft version-1 schedules from Extract A terms for later review and approval
eir:import-disbursements | Import the per-drawdown extract (one row per tranche) with ISO-date and positive-amount checks
eir:import-reference-rates | Import the reference-rate series (the Reserve Bank prime lending rate) with ISO-date and ordering
checks
eir:import-trial-balances | Land MAIIC monthly trial balances in the landing zone and derive the GL side of the EIR
reconciliation
eir:land-pack | Land an E-Banker pack (extract files plus manifest) into the landing zone through its gates
eir:land-takeon | Land the take-on schedules workbook through its gates and build the take-on population
eir:lock-period | Lock (or unlock) a reporting period so that no build restates it
eir:make-test-data | Generate a self-consistent synthetic loan book and EIR extracts for end-to-end testing
eir:poll-feed-folder | Land every new E-Banker pack found in the feed folder (route 2) through the gates
eir:run-revenue | Generate the monthly EIR amortised-cost and interest revenue roll-forward
eir:stage | Stage the loan book of each period: days past due against the governed thresholds, then the missed-instalment
trigger
fli:apply | Propose and approve a fit for the forward-looking route and apply the route to every loan of the period
fli:correlate | Refresh the FLI bridge, profile the series, sweep the correlations under the guardrail and fit the candidates
fli:method-cards | Show each transmission method: what it does, its formula, what it implies, its preconditions checked against
the data, a worked example
ifrs9:generate-2025 | Calibrate PD/LGD from the 2025-11 basis, fill 2025 gap months, and run per-portfolio ECL for all of 2025.
ifrs9:recalculate-ecl | Recalculate IFRS 9 ECL for a reporting period (CLI wrapper around the ECL controller).
ifrs9:seed-agri-risk | Model agri credit enhancements (off-take/warehouse/group/AIP), LGD and cooperative linkage.
ifrs9:seed-report-fields | Derive the empty report fields from trusted columns so all IFRS 9 / RBM reports reconcile.
ifrs9:segment-portfolios | Derive real loan portfolios from product_group and back-fill the RBM sector tag.
ifrs9:smoke-reports | Smoke-test all IFRS 9 reports and PDF rendering.
macro:import-worldbank | Import the World Bank macro series for Malawi into the base scenario, with provenance; falls back to
the committed snapshot
manual:reseed | Replace the User or Administrator Manual with the shipped seed content.
manual:screenshots | Capture hi-res logged-in screenshots of the manual pages via headless Chromium.
megafarm:ecl | Run the Mega Farm programme through the ECL module: the governed scope, PD method, scalar and MAIIC share
scenario:sets | List, seed, validate, approve and lock the governed scenario sets of a period, with their back-test and
sensitivity
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App

### 9.8 Loading from E-Banker: the landing zone and the bootstrap (from 8 October 2026)

From October 2026 the three extract scripts of 9.5 are no longer the source. The system is loaded from the E-Banker tables
themselves, pulled by the queries kept under `docs/bootstrap/queries/` and committed as CSV under `docs/bootstrap/` with
`manifest.json` (every file's query id, row count and SHA-256, and the accepted exceptions). Specification v4 section 6
describes the design; this section is the procedure.

**One command on a clean database.**

```
php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify
```

Step	What it does	Command on its own
1	`migrate:fresh`; refused if the database holds user data unless `--force-wipe` is passed	`php artisan migrate:fresh
--force`
2	Seeds: roles and permissions, the Governance Centre defaults, the staging thresholds (the RBM directive's 91 and 181
days), the query register, the macro series, the help centre, the fee rulebook (unapproved), the compliance modules	`php
artisan db:seed --class=<Seeder>`
3	Lands the committed pack through its gates (file present, hash, row count, query in the register, dates in the manifest's
format, key present and unique) and the 20 trial balances with the AFS bridge	`php artisan eir:land-pack docs/bootstrap
--user=1`; `php artisan eir:import-trial-balances docs/bootstrap/trial-balances/monthly --afs=<bridge>`
4	Lands the take-on workbook: the original as received and the mapping copy with the fee columns; 100 blocks, 3,741
schedule lines, each value with its sheet and cell	`php artisan eir:land-takeon --user=1`
5	Builds: the loan books for every month from July 2024 to the last month in the pack by the method in force (B, derived
from the ledger, by default; A copies the stored report), the take-on population under its basis, the contract master from the
masters, the PLR series, the origination fees from the LOS charges, the interest posted and the cash movements from the ledger,
the spreads, the version 1 schedules approved under the bootstrap label	`php artisan eir:build-loan-books 2024-07 2026-08
--bootstrap`; `php artisan eir:land-takeon --build`; the rest inside the bootstrap
6	Engines, synchronously and in dependency order: macro statistics (live from the World Bank, else the committed snapshot),
staging, EIR solved and locked, revenue for every period, ECL for the last period, GL reconciliation	`php artisan
macro:import-worldbank`; `php artisan eir:stage 2024-07 2026-08`; `php artisan eir:run-revenue <YYYY-MM> --user=1`; `php
artisan ifrs9:recalculate-ecl <YYYY-MM> --portfolio=1`
7	Verifies the golden numbers and exits non-zero on any FAIL: interest posted January 2025 to July 2026 of 5,293,988,207.06
from the ledger; the derived carrying amount equal to the stored report on every account-month; the year-end batch contras on
4215 and 4216; the loan GLs at 31 December 2025 against the trial balance, with 1050201 and 1050202 off by the accepted
exception of specification section 3.5	part of `eir:bootstrap --verify`

On the build machine the whole run takes about 80 seconds. Anything the bootstrap approves (a load, a build, a schedule, a fee
classification by rule) carries the label "System Bootstrap (automated data-readiness, not a MAIIC approval)". It never
approves the fee rulebook itself: a MAIIC reviewer does, on the Accounting Rules screen, and until then a contract whose fees
are unclassified stays blocked at the fee gate, which the Coverage & Blockers screen shows.

Every month, by the feed. Barry runs the versioned queries (Data Foundation, E-Banker Feed, "Download the queries"), zips
the CSV files with `manifest.json`, and uploads the zip on the same screen (route 1); the gates run and the pack is landed or
quarantined with the file and row named. Then a build is proposed for the month and a second person approves it; the
differences from the previous build are shown first and a locked period (`php artisan eir:lock-period <YYYY-MM> --user=<id>
--reason="..."`) is never restated. The engines run from their screens or by the commands above.

The EIR at any date. `php artisan eir:as-at <YYYY-MM-DD> [--contract=<id>]`, or Report Hub, EIR as at a Date: a month-end
reads the locked roll-forward row; a date inside a month accrues the EIR on the actual days from the prior month-end less the
cash received; a date after the last loaded posting is refused with that date named.

Interim scripts. The Python scripts under `docs/build-files/` (`demo_load_loan_books.py`, `demo_contract_master.py`,
`demo_schemes.py`, `demo_stage.py`) were the interim load of the 8 October demo and are kept as a record; the bootstrap
replaces them.

CLAUDE (2026-10-09 10:01:54 UTC)

Here's where things stand while the three agents work. Your answers first.

Loan Book and ECL table: my recommended design (the agent is building it now):

Screen	Its job	What it shows
Loan Book	*What the book is*	contract, customer, product, sector, stage, days past due, RBM class, carrying amount,
undrawn commitment, EAD, **locked EIR**, ECL, coverage. Opening a row shows that loan's IFRS 9 trail: **PD before FLI → FLI
adjustment % → PD after FLI**, LGD, how EAD is built (carrying + undrawn × utilisation), ECL, the fit and scenario set it ran
under, and a link to Audit Trace.
ECL Calculation	*How the ECL was built*	EAD, PD before FLI, FLI %, PD after FLI, LGD, ECL (undiscounted and
discounted), coverage, with totals, filtered by stage, product or sector
Dashboard	*Where we stand*	a new **ECL build-up**: ECL before FLI → forward-looking effect → manual overlays → final
ECL, plus ECL by product group, by sector and by RBM class, all tying to the totals and included in the dashboard PDF

The PD columns are kept off the main Loan Book table, so it stays readable for operations staff. Risk users get the full detail on the ECL table and in each loan's trail.

Portfolios, products and sectors:

- **1 portfolio ("Loans"):** all 135 loans are in one portfolio, so PD and LGD are calculated for the whole book. The system has a command to split the book into its real programmes, MAIIC and FInES, by product group: `php artisan`

`ifrs9:segment-portfolios`. It has never been run on the demo database.

- **Products:** the Product Groups screen is empty, but the loans carry 6 product groups and their GL codes (FInES Industrial and Agricultural, MAIIC Industrial, Term, Agricultural, and one other). Reports group by product using those.
- **Sectors:** 9 sectors are set up and are used by the "ECL by segment" report. **57 loans carry E-Banker's default industry code 4290 ("civil engineering")**, including an eye-care centre, a lodge and a farmers' cooperative. Until Barry sends the correct codes, the sector view will show "construction" as the biggest risk, and that's wrong.
- **RBM:** the RBM classification and provisioning reports classify by the directive's classes (Pass, Special Mention, Substandard, Doubtful, Loss), with short-term and long-term bands. They report by class, not by sector. PD isn't calculated by sector or class anywhere; it's one PD per stage.

Being worked on now:

1. Fixing the as-at-date bug in the forward-looking engine, with tests, then re-running Jan to Aug on a correct basis.
2. Forward-looking screens: the 7 legacy screens moved out to an Administration "Legacy FLI tools" entry, plain-English correlation results, the approved fit pinned at the top, and a better Scenario Sets layout.
3. The Loan Book, ECL table and dashboard design above.

Everything gets pushed as each piece passes the build. When all three are done, you'll get the full rundown: how the system works end to end, and the exact commands the client runs.

Tool call: AskUserQuestion

```
{
 "questions": [
  {
   "question": "Should I split the book into its real programmes (MAIIC and FInES portfolios, via the system's own
ifrs9:segment-portfolios) after the forward-looking re-run finishes? PD and LGD would then be calculated per programme, which
changes the ECL.",
   "header": "Portfolios",
   "multiSelect": false,
   "options": [
    {
     "label": "Yes, split and re-run",
     "description": "Create MAIIC and FInES portfolios from the product groups, then re-run staging, PD, LGD, FLI and ECL per
portfolio for Jan-Aug 2026."
    },
    {
     "label": "Report only, keep one PD",
     "description": "Keep one pooled portfolio for PD/LGD (more stable with 135 loans) but show every report and the dashboard
split by programme and product."
    },
    {
     "label": "Ask Dr Thom first",
     "description": "Leave as is; raise it in the meeting as a methodology choice."
    }
   ]
  }
 ]
}
```

Result of AskUserQuestion

```
Your questions have been answered: "Should I split the book into its real programmes (MAIIC and FInES portfolios, via the
system's own ifrs9:segment-portfolios) after the forward-looking re-run finishes? PD and LGD would then be calculated per
programme, which changes the ECL."="Yes, split and re-run". You can now continue with these answers in mind.
```

USER, sent while Claude was working (2026-10-09 10:01:48 UTC)

we want the system to be able clalulate pds by portfolios, by sectors if its psoosble can u build that end ti end or its difficlut and thieir sp reporting they have their classes that they show with their pds that come from the rbm

CLAUDE (2026-10-09 10:02:30 UTC)

Yes, this can be built end to end. Checking what the system already supports before I scope it: how the PD engine segments today, and what it holds for the RBM classes and their rates.

Tool call: Bash

```
description: Read PD engine segmentation and find RBM class rates
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -n 1,60p app/Services/Pd/PdEngineService.php | grep -v "^\s*$" | head -45; echo ----;
grep -rln -i "substandard" app config database/seeders | head -8
```

Tool call: Bash

```
description: Find RBM provisioning rates and segment-portfolios logic
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -rn -i -E "substandard|doubtful|special mention" app/Services app/Support config 2>/dev/
null | grep -i -E "rate|%|0\.[0-9]|provision" | head -12; sed -n 1,40p app/Console/Commands/SegmentPortfolios.php | grep -E "^\
s*\*|signature|description" | head -20
```

Result of Bash

```

Tool call: Agent

```
description: PD by portfolio, sector, RBM class
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md fully (you are "segments"). Build in MAICC-IFRS9 (C:\xampp\htdocs\MAICC-IFRS9, branch eir_revenue_recognition):
PD (and LGD where the engine supports it) calculated by PORTFOLIO, by SECTOR, and shown by RBM CLASS, end to end. The user
approved splitting the book into its real programmes.

## Coordination (important)
- Another agent ("fli-engine") is right now fixing the forward-looking engine and re-running FLI + ECL for Jan-Aug 2026 on
maiic_ifrs9_demo with portfolio 1. DO NOT write to maiic_ifrs9_demo (no seeders, no segment-portfolios, no engine runs) until
the coordinator sends you a message saying "DB is free". Until then: read the DB, write code and tests (tests use sqlite
in-memory per phpunit.xml).
- Other agents edit: FLI services (fli-engine), FLI Vue pages (fli-ui), LoanBooks/Index.vue, ExpectedCreditLoss/Index.vue +
ExpectedCreditLossController::index, Dashboard.vue + DashboardController (book). Avoid those files; if you must touch
ExpectedCreditLossController (the calculation path, not index()), make small exact edits and re-read first.

## What exists
- app/Services/Pd/PdEngineService::run($period, $portfolioId, $windowMonths): transition matrix over staged loan books for ONE
portfolio (pd_calculation_level='portfolio'), writes pd_prefli by stage. LgdEngineService similar. ECL: `ifrs9:recalculate-ecl
P --level=portfolio --portfolio=N --pd=...`; expected_credit_loss rows carry ecl_calculation_level/id. Workspace, dashboard and
reports read these.
- `php artisan ifrs9:segment-portfolios` (app/Console/Commands/SegmentPortfolios.php) derives real portfolios from
loan_books.product_group (MAIIC Industrial, MAIIC Agricultural, MAIIC Term, FInES Industrial, FInES Agricultural, ...) and
"back-fills the missing RBM sector tag" - CHECK exactly what it writes: it must NOT overwrite E-Banker's sector codes. NOTE a
data issue: 57 of 135 Aug-2026 loans carry E-Banker industry_code 4290 ("civil engineering") although they are clearly not
construction (eye care, lodge, transport, a farmers' cooperative): an E-Banker default. Do not "fix" sectors by guessing;
sector PD must show this honestly (e.g. flag sector code 4290 as "unverified default code") and the report should say so.
- RBM classes: app/Services/Rbm/RbmReturnService.php (directive s.10 bands by short/long term; MINIMUM provisions Pass 0,
Special mention 5%, Substandard 20%, Doubtful 50%, Loss 100%). Reports ifrs9-reports rbm-classification / provision-comparison
(now merged into "RBM classification & provisioning").
- Governance Centre: governed settings with maker-checker, read "as at" a date (GovernanceSetting / the governance service; see
how other engine settings like dpd_basis or stage_cure_months are read).

## Build
1. A governed setting `pd_segmentation_basis` (values: portfolio [default], book (pooled), sector, portfolio_sector) plus
`pd_segment_min_observations` (a minimum number of loan-month observations and/or Stage 3 entries for a segment's own PD). Seed
them through the system's governance seeder pattern (defaults in force from inception, like the others). A segment below the
minimum must FAIL CLOSED with a named reason, or use a documented governed parent rule (e.g. "a sector below the minimum takes
its portfolio's PD") ONLY if that rule is itself an explicit governed setting the user can see - never a silent fallback. Show
the chosen rule in the Governance Centre with a plain description.
2. PD engine: compute per segment per the basis (extend PdEngineService cleanly; pd_calculation_level 'portfolio'/'sector'/...
with the segment key recorded on the matrix so lineage is auditable); LGD per portfolio where the engine supports it. ECL then
runs per segment so expected_credit_loss rows carry the segment.
3. REPORTING, not engine: "PD by RBM class" - the observed one-year PD per RBM class (transition to Stage 3 / default by the
class a loan was in at the start of the window), next to the RBM minimum provisioning rate and the IFRS 9 ECL coverage per
class. Add it as a part of the consolidated "RBM classification & provisioning" report (app/Http/Controllers/Reports/
Ifrs9ReportsController.php + its Report.vue part) and "PD by portfolio" / "PD by sector" parts in "ECL by segment". These are
reports; the ECL keeps using the governed basis.
4. Tests (sqlite): segmentation produces per-segment PDs, a thin segment fails closed (or follows the governed parent rule),
lineage recorded, the RBM-class PD report computes correctly on a fixture.
5. When the coordinator says "DB is free": backup maiic_ifrs9_demo to "C:/Users/DELL/OneDrive/2026/Projects/MAIIC/3. Project
Execution/Database Backups/maiic_ifrs9_demo_pre-segments_2026-10-09.sql.gz", run `ifrs9:segment-portfolios` (check output),
seed the new settings, re-run staging (`eir:stage`), PD, LGD, FLI route (`fli:apply` or the service, same approved-fit rule and
maker-checker as the fli-engine agent used: proposer Admin user 1, approver user 2 "Demo Approver (not MAIIC)", label "Demo,
not a MAIIC approval") and ECL with --pd=pd_post_fli, per portfolio, for Jan-Aug 2026. Never run book-wide engines on 2025-11
(it also holds 3,490 Mega Farm rows). Verify the totals and report per month and per portfolio.
Commit code + tests in logical chunks (own files only), do not push. Final report: design, settings, files, tests, the
per-portfolio PDs and ECL by month, the PD-by-sector and PD-by-RBM-class tables for Aug 2026, every segment that failed the
minimum and why, and anything an auditor or Dr Thom would question.
{
 "subagent_type": "general-purpose",
 "run_in_background": true
}
```

Result of Agent

```
Async agent launched successfully. (This tool result is internal metadata — never quote or paste any part of it, including the
agentId below, into a user-facing reply.)
agentId: a0606d238c3888a42 (internal ID - do not mention to user. Use SendMessage with to: 'a0606d238c3888a42', summary: '<5-10
word recap>' to continue this agent.)
The agent is working in the background. You will be notified automatically when it completes. You know nothing about its
results until that notification arrives — do not report, assume, or predict them; continue other work or respond to the user in
the meantime.
Do not duplicate this agent's work — avoid working with the same files or topics it is using.
output_file: C:\Users\DELL\AppData\Local\Temp\claude\c--xampp-htdocs-Stress-Testing-App\c9a0f915-2064-4f18-9b98-77857ef71421\
tasks\a0606d238c3888a42.output
Do NOT Read or tail this file via the shell tool — it is the full subagent JSONL transcript and reading it will overflow your
context. If the user asks for progress, say the agent is still running; you'll get a completion notification.
```

CLAUDE (2026-10-09 10:03:34 UTC)

Yes, it can be built end to end. The segmentation agent has started on the code, and it waits for the forward-looking re-run to finish before it touches the demo data.

What's being built:

1. **A governed choice of PD basis** in the Governance Centre: whole book, by portfolio (the default), by sector, or portfolio and sector together. Like the other governed settings, it's proposed by one person and approved by another.
2. **A minimum-data rule for each segment.** A sector with too few loans or defaults can't support its own PD. The engine will either refuse it with a named reason, or apply a visible, approved rule such as "a thin sector takes its portfolio's PD". It will never silently substitute a number.
3. **PD, LGD and ECL calculated per segment,** with each segment recorded on the matrix, so the Audit Trace shows exactly which PD a loan used.
4. **New report parts:**
   - **PD by RBM class:** for each RBM class, the PD observed from MAIIC's own data, next to the regulator's minimum provision for that class (Pass 0%, Special Mention 5%, Substandard 20%, Doubtful 50%, Loss 100%) and the IFRS 9 coverage. It answers "RBM says hold at least X; our model says Y; we hold Z".
   - **PD by portfolio** and **PD by sector**, in the ECL by segment report.
5. **Then the re-run:** split the book into MAIIC and FInES portfolios, and re-run staging, PD, LGD, the forward-looking adjustment and ECL per portfolio for Jan to Aug 2026. The demo database gets backed up first.

Two things to know before you show sector PDs:

- **The 4290 problem.** With 57 loans on E-Banker's default civil-engineering code, sector PDs can't be trusted until Barry supplies the real codes. The report will flag 4290 as "unverified default code" rather than present it as construction risk.
- **Thin data.** 135 loans split six ways means some sectors will have only a handful of loans and almost no defaults. Expect several segments to fail the minimum, which is the honest answer.

Agents running right now:

- The forward-looking date fix and Jan to Aug re-run.
- The forward-looking screen fixes.
- The Loan Book, ECL table and dashboard redesign.
- PD segmentation, which follows the forward-looking re-run.

I'll push each batch once it passes the build. When everything's in, you'll get the full rundown of how the system works end to end and the exact month-end commands the client runs.

CLAUDE (2026-10-09 10:17:33 UTC)

The forward-looking engine fix is done. Pushing it, then letting the segmentation agent onto the database.

Tool call: Bash

```
description: Push the FLI engine fix

CLAUDE (2026-10-09 10:18:01 UTC)

The forward-looking date bug is fixed, tested and pushed. Jan to Aug have been re-run on a correct basis.

The fixes:

- **No more look-ahead.** Each month now uses only the data that was available on its own reporting date. A test proves that adding later data can't change an earlier month's fit.
- **The 9-month lag is now applied.** The adjustment compares the driver nine months back with where the scenario takes it.
- **Booked and scenario-weighted ECL now agree exactly.** The 0.2% gap came from averaging the PDs before weighting instead of weighting the ECL. They now match to within a few kwacha.

The corrected results, which change the story:

```
| Month | ECL before FLI | ECL after FLI | Effect |
|---|---|---|---|
| Jan 2026 | 5,290m | 5,421m | **+2.5%** |
| Mar 2026 | 6,116m | 6,018m | **−1.6%** |
| Jun 2026 | 8,509m | 8,110m | −4.7% |
| **Aug 2026** | **10,517m** | **10,109m** | **−3.9%** |
```

From March the forward-looking adjustment *lowers* the ECL. Measured correctly, the model sees the PLR falling from 25.3% to about 20.8% and expects fewer loans to reach Stage 3. Each month now has its own fit (R^2 from 0.88 in January to 0.74 in August). Before the fix, every month carried August's fit.

Before you present this:

1. **Dr Thom will probably challenge the reduction.** It rests on 19 to 26 monthly points of a slow-moving ratio and a single interest-rate driver, so take it as model output, not a firm conclusion. Many institutions would hold a management overlay or a downside weight rather than release provision on that evidence.
2. **The base path assumes no change in the PLR,** because no RBM forecast is loaded. Loading the RBM's stated policy path would make the base case more defensible.
3. **Stage 2 gets the 12-month adjustment, not a lifetime one.** That's existing behaviour, left as it was.

Updated meeting figure: August ECL **10.11bn**, coverage about 43%, with the forward-looking effect at −408m.

The segmentation agent now has the database. It's splitting the book into the MAIIC and FInES portfolios, then re-running PD, LGD, the forward-looking adjustment and ECL per portfolio. Also still running: the forward-looking screens (their menu change is already pushed) and the Loan Book, ECL table and dashboard redesign.

CLAUDE (2026-10-09 10:19:24 UTC)

The forward-looking screens are done. Before pushing I'll deal with two of the risks the agent flagged:

1. **The legacy External Calculations screen can still overwrite the governed forward-looking PD on every loan.** I'll make its "update loan book" action refuse, so only the governed route can write it.
2. **Wide tables are clipped at the panel edge** instead of scrolling, which affects every page. I'll fix that once in the shared styles.

Tool call: Bash

```
description: Read the legacy loan-book overwrite action
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -A12 "function updateLoanBook" app/Http/Controllers/FLI/
ExternalCalculationsController.php | head -20; grep -rn "updateLoanBook" routes/web.php | head -3
```

Result of Bash

```
317:    public function updateLoanBook(Request $request)
318-    {

Heads-up from the fli-ui agent: period 2026-08 al…
{
 "to": "a0606d238c3888a42",
 "summary": "Avoid duplicating FLI fits",
 "message": "Heads-up from the fli-ui agent: period 2026-08 already holds duplicate fits (two copies of the same fit set, e.g.
3298 and 163), so the Regression list shows ~418 fits instead of ~209. When you re-run the chain per portfolio, check how
fli:correlate stores runs (a later sweep should be a new run, not extra copies in the same list) and do not pile on more
duplicates; if the code genuinely duplicates fits on a re-run, report it with file:line (or fix it if it is clearly a bug in
code you own, with a test). Also: the legacy External Calculations \"update loan book\" action is now disabled (coordinator
commit), so only the governed route writes pd_post_fli.",

Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 10:23:07 UTC)

The forward-looking screens are done and pushed. Refresh 8050 to see them.

The menu now matches the real process:

- **Forward-Looking Model:** Correlation Finder, then Regression (FLI Adjustments).
- **Scenarios & Overlays:** Scenario Sets, then Manual Overlays.
- **The seven legacy tools** now sit under **Administration → Legacy FLI tools**. Each one opens with a line saying it isn't used by the ECL. Before moving them, the agent checked the code: none of them feeds the ECL.

The screens:

- **Correlation Finder** reads in plain English, for example: *"Inflation (consumer prices) explains 74% of the movement in the NPL ratio of MAIIC agricultural loans, 6 months later (24 months of data, Jul 2024 to Jun 2026). Sign as expected."* Series show their full names, and the technical detail is one click away.
- **Regression** shows the approved fit as a card at the top: driver, lag, R^2, months of data, and who proposed and approved it. The fits list pages at 15, and nothing is cut off.
- **Scenario Sets** gives each scenario its own readable card. The paths table has no duplicate column, and the downside and severe scenarios are fully visible.

Two fixes I added:

- **The legacy External Calculations tool could still overwrite the governed forward-looking PD on every loan.** That would have quietly replaced the approved model's result. It now refuses, so only the approved fit and scenario set can set the post-FLI PD.
- **Wide tables now scroll inside their panel** across the system, instead of being clipped at the edge.

One issue for the segmentation agent to watch: August holds duplicate copies of the fits from the re-runs, so the Regression list shows about 418 fits instead of 209. It's checking whether a re-run creates copies and won't add more.

Still running:

- The Loan Book, ECL table and dashboard redesign.
- PD by portfolio, sector and RBM class, with the MAIIC/FInES split and the re-run.

The full end-to-end rundown and the client's month-end commands follow once both are in.

CLAUDE (2026-10-09 10:24:50 UTC)

The Loan Book, ECL table and dashboard redesign is finished. Checking the build and pushing.

Tool call: Bash

```
description: Build and push the loan book redesign

## eir_revenue_recognition...origin/eir_revenue_recognition
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-09 10:25:37 UTC)

The Loan Book, ECL table and dashboard redesign is pushed. Refresh 8050 to see it.

Loan Book: what the book is. Each row shows:

- contract and customer;
- product group and sector;
- the stage with its RBM class underneath;
- days past due;
- carrying amount, with the undrawn commitment underneath;
- the **engine's EAD**;
- the **locked EIR**, or "Pending" for the 113 contracts not yet locked;
- ECL and coverage.

There are new filters for product group and sector. **Opening a row shows that loan's full IFRS 9 trail:**

- the PD before FLI, the forward-looking adjustment, the PD after FLI, and the PD used for each scenario;
- the LGD and where it comes from (FLI changes the PD only, so there's one LGD);
- how EAD is built (carrying + undrawn × utilisation);
- the ECL before FLI, the forward-looking effect and the booked ECL, with a line proving EAD × PD × LGD equals the booked ECL;
- the fit and scenario set the loan ran under;
- a link to Audit Trace.

ECL Calculation: how the ECL was built.

- **Undiscounted tab:** EAD, PD before FLI, FLI adjustment, PD after FLI, PD used, LGD, ECL before FLI, ECL and coverage.
- **Discounted tab:** EAD, PD after FLI, LGD, undiscounted ECL, the EIR used, horizon, discounted ECL and the discounting effect.
- Both tabs have totals over everything filtered, and the same new filters.

Dashboard.

- **ECL build-up:** a small waterfall from ECL before FLI to the forward-looking effect to manual overlays to booked ECL, with a "Ties to the total ECL" badge and the fit and scenario set it ran under.
- **Where the ECL sits:** a switch between product group, sector and RBM class (the last with the RBM minimum provision beside it). Every view's totals match the headline figures.
- The dashboard PDF includes both panels.

Checked against the database: every loan's ECL recalculates from its saved inputs to the cent. The build-up ties to the booked ECL for every month tested.

Two corrections found along the way:

- The Loan Book's "Total EAD" was really the carrying amount. It now shows the engine's EAD (24.6bn for August).
- The stored `ead` column (28.6bn) counts every undrawn commitment in full, which isn't what the engine uses. The screens no longer read it.

The August figures have moved again. The segmentation agent is re-running PD, LGD, FLI and ECL per portfolio (MAIIC and FInES) right now, and the screens follow the database. At the last read, August stood at ECL before FLI 11.50bn, forward-looking effect −438m, booked 11.06bn. **Don't quote a final figure yet.** Wait until the segmentation agent finishes and I've confirmed the totals.

That's the last agent still running. When it's done you'll get the final figures, the PD-by-portfolio, sector and RBM-class tables, and the full rundown of how the system works with the client's month-end commands.

USER (2026-10-09 10:27:40 UTC)

<pasted_content id="88ea">

thresholds the engine applies

The screen edited finance_stageing_rules, which no engine reads (loans are staged from staging_thresholds and the governed
settings); its tab is gone and the address opens Settings, Staging basis. The annual-report note took its staging wording from
that table and told the reader Stage 3 starts after 90 days; it now states the thresholds in force at the closing month end (91
days short-term, 181 days medium and long-term, 91 days Mega Farm).

Tool call: Agent

```
description: Transition matrix popup like TNM
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md fully (you are "matrix"). Task in MAICC-IFRS9: make the transition matrix pop-up (titled "View Transition Matrix
(Normal)" - find it in resources/js/Pages/TransitionMatrix/*, e.g. ViewEditMatrix.vue or a modal in Index.vue/Cummulative.vue;
also the cumulative one if it shares the component) look and read like TNM Mpamba's. In TNM (C:\xampp\htdocs\TNMMpamba, read
only) commit ed91813 "One command to set up the transition profiles; clearer matrix popup" and the later PD commits overhauled
it - read TNM's matrix popup component and copy its design in MAIIC colours.
Today MAIIC's popup shows raw unformatted amounts (2136879227.14), meaningless headers like "1 (1.00 to 1.00) 1", a "Paid (0.00
to 0.00)" column and a PD% column. Make it: a clear title (matrix window from-to, portfolio/segment, calculation basis
amount-weighted vs count, PD method), headers "Stage 1 / Stage 2 / Stage 3 / Paid" (from the profile's grade labels, never
hardcoded), amounts formatted with thousands separators in the reporting currency from settings, each cell also showing the row
percentage (share of the start-stage total that moved there), a heat colouring of the percentages (green on the diagonal for
Stage 1 staying, amber/red as loans move to worse stages), the row total and the PD to Stage 3 per row highlighted, a column
total row, a one-line explanation of how PD% is derived, and a Download (CSV/Excel) if TNM has one. Keep the edit mode (Normal
vs edit) working if it exists. Verify the figures are unchanged (formatting only; check one row's PD% = to-Stage-3 / row
total). Do not edit engine services (PdEngineService etc.) or the matrix calculation.
Another agent ("segments") is changing PD segmentation and writing transition matrices on the demo DB right now - don't run
engines; just open existing matrices. Build with TOOLS/build.sh, screenshot before/after (TOOLS/shots/matrix/), commit own
files, do not push. Short final report.

description: SICR qualitative factors end to end
--- prompt ---
Read C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools/BRIEF.md fully (you are "sicr"). Task in MAICC-IFRS9 (C:\xampp\htdocs\MAICC-IFRS9): make the qualitative SICR
(significant increase in credit risk) factors work end to end, and seed a realistic starter set so MAIIC can see how it works.

## 1. Is it really working? Find out and fix
Screens: SICR Groups (sicr-groups.index), SICR Alert Items (sicr-items.index), SICR Trigger Alerts (sicr-triggers.index);
tables finance_sicr_groups, finance_sicr_items, finance_sicr_triggers (all empty in maiic_ifrs9_demo). Trace in code whether a
trigger raised on a loan actually changes its stage: the staging engine (`eir:stage`, app/Services/... StagingService /
StagingClassifier) writes ifrs9stage_pre_qualitative (days past due under staging_thresholds) and ifrs9stage_post_qualitative
(after qualitative triggers) - check exactly what moves a loan from pre to post: do finance_sicr_triggers feed it, keyed how
(contract/account, period, active dates)? Does a trigger move Stage 1 -> Stage 2 (SICR) and can a credit-impairment indicator
move to Stage 3? Is there a governed setting (e.g. staging_rebuttal, stage_cure_months) that interacts? Does the ECL then use
the post-qualitative stage (it should: the PD engine, ECL and reports read ifrs9stage_post_qualitative)? If any link is missing
or broken, fix it properly (engine + screens), with tests (sqlite) proving: a loan 0 DPD with an active SICR trigger is Stage 2
post-qualitative; a credit-impaired trigger gives Stage 3; an expired/closed trigger does not apply; cure period honoured if
the engine has one; the trigger and who raised/approved it is recorded for audit (Audit Trace should show it if it shows
staging inputs). Raising a trigger should follow maker-checker if the system's pattern for governed actions does (propose/
approve) - check how other governed records do it; if the screens have no approval, add the minimum: raised by, reason,
evidence note, effective from/to.

## 2. Seed a starter set of qualitative factors (IFRS 9 B5.5.17, B5.5.37 and Appendix A credit-impaired evidence; RBM DFI
directive context; an agricultural/industrial development finance institution in Malawi)
Seeder (idempotent, e.g. database/seeders/SicrQualitativeFactorsSeeder.php, add to the bootstrap seeder list if there is one):
groups and items such as
- Forbearance and restructuring: restructured/rescheduled due to financial difficulty (SICR); second restructuring within 12
months (credit-impaired); payment holiday / moratorium extension not in the original terms.
- Borrower financial condition: significant decline in revenue/cash flow; breach of financial covenant; late or qualified
audited financial statements; negative net worth; key customer/off-taker lost.
- Agricultural and climate: crop failure / drought / flood affecting the borrower's area (B5.5.17(f)); commodity price fall for
the financed crop; off-take agreement cancelled; warehouse receipt or collateral crop deterioration.
- External and market: adverse change in the borrower's sector or region; foreign exchange shock on a borrower with
forex-denominated costs; loss of licence/permit.
- Behavioural and relationship: on the watchlist / early-warning list; delinquency with another lender (credit reference
bureau); cheque bounces / account overdrawn; management change or key-person loss; legal action or fraud suspicion.
- Credit-impaired evidence (Stage 3): borrower in liquidation/administration; death of a sole guarantor with no successor;
probable bankruptcy; disappearance of an active market for the security.
Each item: name, description in plain English, the stage it implies (2 SICR or 3 credit-impaired), and whether it needs
evidence. Use the item table's real columns (add columns only if needed for the stage implied, with a migration).
Optionally seed 2-3 DEMO triggers on real demo loans to show the effect (clearly labelled "Demo trigger, not a MAIIC
assessment") - but ONLY after the coordinator messages you "DB is free" (another agent "segments" is re-running staging/PD/ECL
on maiic_ifrs9_demo right now; do NOT run eir:stage, PD or ECL, and do not write per-loan triggers until then; writing the
group/item definitions is fine now). When free: add the demo triggers, re-stage only the affected months with the system's
command, and report the before/after stage and ECL for those loans.

## 3. Screens
Make the three screens read clearly (BRIEF rules): Groups and Items show which stage each item implies; Trigger Alerts lists
active triggers per loan with item, stage implied, raised by/when, evidence, effective dates, status; a short "How qualitative
SICR works" disclosure (closed by default) explaining pre- vs post-qualitative stage in plain English.
Build with TOOLS/build.sh, screenshot (TOOLS/shots/sicr/), commit own files in logical chunks, do not push. Final report: was
it working (what was missing), what you fixed (file:line), tests, the seeded factors, and (if done) the demo triggers' effect.

tasks\a3910933b6a95a5c2.output
Do NOT Read or tail this file via the shell tool — it is the full subagent JSONL transcript and reading it will overflow your
context. If the user asks for progress, say the agent is still running; you'll get a completion notification.
```

CLAUDE (2026-10-09 10:31:40 UTC)

I've made one fix and started two new agents.

Fixed and pushed: the Quantitative Thresholds screen is gone. Nothing read it except the IFRS 9 annual-report note, and that was a real error: the note told readers Stage 3 starts after 90 days. MAIIC stages under the RBM directive, so the note now states the thresholds actually in force at the closing date:

- short-term loans: Stage 2 from 31 days past due, Stage 3 from 91 days;
- medium and long-term loans: Stage 2 from 31 days, **Stage 3 from 181 days**;
- Mega Farm: Stage 3 from 91 days.

The old address now opens Settings → Staging basis, where the real thresholds are shown.

Agents working now:

1. **Transition matrix pop-up.** Rebuilt like TNM's: plain stage headings (no more "1 (1.00 to 1.00)"), amounts with thousands separators in MWK, each cell's percentage share with heat colouring, the PD to Stage 3 highlighted per row, totals, and a one-line explanation of how PD% is worked out. Only the display changes; the figures stay the same.
2. **SICR qualitative factors.** It's checking whether a trigger raised on a loan actually moves its stage from before the qualitative overlay to after it, and on into PD and ECL. If any link is broken, it fixes it, with tests. Then it seeds a starter set of qualitative factors in line with IFRS 9 (B5.5.17 and the credit-impaired evidence in Appendix A), for example:
   - **forbearance:** restructured because of financial difficulty;
   - **borrower condition:** covenant breach, falling cash flow;
   - **agricultural and climate:** drought or flood in the borrower's area, crop price fall, off-take agreement cancelled;
   - **behaviour:** on the watchlist, default with another lender at the credit bureau;
   - **Stage 3 evidence:** liquidation, death of a sole guarantor.

Each factor will show which stage it implies. Once the segmentation re-run frees the database, it will add 2 or 3 clearly labelled demo triggers on real loans, so you can see a loan move stage and its ECL change.

Also still running: PD by portfolio, sector and RBM class, with the MAIIC/FInES split and the re-run.

When everything is in, you'll get the final August figures and the full rundown of how the system works with the client's month-end commands.

CLAUDE (2026-10-09 10:38:01 UTC)

The segmentation work is finished. Checking the build, pushing, then giving the SICR agent the database.

Tool call: Bash

```
description: Build, test and push segmentation work
--- command ---
bash "C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/tools/build.sh" | tail -1; cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan test tests/Feature/Pd tests/Feature/
NavigationTest.php 2>&1 | grep -E "Tests:|FAIL" | head -3; git fetch -q origin && git log --oneline origin/
eir_revenue_recognition..HEAD | cat && git push -q origin HEAD:eir_revenue_recognition 2>&1 | tail -1; git status -sb | head -1
{
 "timeout": 600000
}
```

Tool call: SendMessage

```
--- content ---
DB is free. The segments agent finished (pushed):…
{
 "to": "a3910933b6a95a5c2",
 "summary": "DB is free",
 "message": "DB is free. The segments agent finished (pushed): the book is now split into portfolios 2-8 (MAIIC Industrial,
MAIIC Agricultural, MAIIC Term, MAIIC Loans GL 1050103, FInES Industrial, FInES Agricultural, Mega Farm); PD/LGD run per
portfolio via `php artisan ifrs9:segment-parameters <from> <to>`, the FLI route via `fli:apply` (approved as-at fits 1815/2024/
2233/2442/2651/2860/3069/3278, proposer user 1, approver user 2, label \"Demo, not a MAIIC approval\"), and ECL via `php
artisan ifrs9:segment-ecl <from> <to> --pd=pd_post_fli --prune-stale`. Note a new PD run clears pd_post_fli, so after
re-staging any month you must re-run, in order: eir:stage for that month, ifrs9:segment-parameters, fli:apply (reuse that
month's approved fit), ifrs9:segment-ecl --pd=pd_post_fli. Do not touch 2025-11. You may now add the labelled demo triggers and
re-stage only the affected months; report before/after stage and ECL for those loans and the new month totals.",

Controllers/ExpectedCreditLossController.php 2>/dev/null && git commit -q -m "ECL calculation fails closed when a loan with
exposure has no stage, PD or LGD

The recalculation wrapped PD and LGD in IFNULL(..., 0), so such a loan silently carried zero ECL; the run now refuses and names
the loans, on the screen and from ifrs9:recalculate-ecl.

CLAUDE (2026-10-09 10:40:56 UTC)

My commit contains only my 27 lines; the SICR agent's work stays separate.

Yes, the data is in now. It landed a few minutes after your screenshot. Refresh SICR Groups and you'll see:

- **6 groups:**
  - forbearance and restructuring;
  - borrower financial condition;
  - agricultural and climate;
  - external and market;
  - behavioural and relationship;
  - credit-impaired evidence.
- **25 qualitative factors (Alert Items)**, each showing which stage it implies: Stage 2 for a significant increase in credit risk, or Stage 3 for credit-impaired.
- **Trigger Alerts is still 0.** The agent's next step is 2 or 3 demo triggers on real loans, labelled "Demo trigger, not a MAIIC assessment". It will re-stage those months so you can see a loan move stage and its ECL change. It's also confirming that a trigger really flows through to the post-qualitative stage, PD and ECL, and adding tests.

Also pushed in the last few minutes:

- **The transition-matrix pop-up in TNM's style.** The title shows the window and segment (e.g. "Jul 2025 to Jul 2026, Pooled book"), with plain Stage 1, Stage 2, Stage 3 and Paid headings. Amounts are formatted in MWK, each cell shows its share of the row with heat colouring, and the PD to Stage 3 is highlighted. There's a one-line explanation and a CSV download. Its Close button didn't work before; it does now.
- **PD by portfolio, sector and RBM class**, with the book split into its programmes (MAIIC Industrial, Agricultural and Term, FInES Industrial and Agricultural).
- **A safety fix in ECL.** A loan with exposure but no PD or LGD used to get zero ECL without any warning. The run now refuses and names the loans.

When the SICR agent finishes, you'll get the final August figures and the full rundown of how the system works, with the client's month-end commands.

USER (2026-10-09 10:50:13 UTC)

there is data beig added in the maiic 026 foler check it when it comes in the one drive , in pack 3 in the 2026 maiic project folder if that data is important to what we are doing

CLAUDE (2026-10-09 10:50:44 UTC)

Looking for Pack 3 in the MAIIC project folder on OneDrive.

Tool call: Bash

```
description: Find Pack 3 folder and files added today
--- command ---
B="/c/Users/DELL/OneDrive/2026/Projects/MAIIC"; find "$B" -maxdepth 5 -type d -iname "*pack*3*" 2>/dev/null; echo ---; find
"$B" -newermt "2026-10-09 09:00" -type f 2>/dev/null | grep -v -i "Database Backups" | grep -i -v "\.sql\.gz" | head -40
```

Result of Bash

```

===== BIG FILES - export MF_03 with SPOOL (result set exceeds 100 MB).txt
BIG FILES - EXPORT WITH SPOOL  |  Dupleix Institute  |  9 October 2026

Why: SQL Developer holds at most 100 MB of a result in its grid. A bigger
result (the Mega Farm ledger, MF_03) stops with "result set exceeds the
maximum size (100 MB)", and an export taken then is a TRUNCATED file that
looks complete. SPOOL writes straight to disk with no size cap.

How: paste the block below into the worksheet and run it with RUN SCRIPT
(F5), not Run Statement. Create the folder C:\exports first (or change the
path). RUN 0 still comes first in the same worksheet.

-- RUN 0 (once, first)
ALTER SESSION SET NLS_DATE_FORMAT = 'YYYY-MM-DD HH24:MI:SS';
ALTER SESSION SET NLS_NUMERIC_CHARACTERS = '.,';

-- MF_03: the Mega Farm ledger (RUN 4 of the pack-3 sheet, unchanged)
SET SQLFORMAT csv
SPOOL C:\exports\MF_03_ledger_all.csv
SELECT cv.*
FROM   cumvouch cv
WHERE  cv.new_ac_number IN (SELECT a.new_ac_number FROM acmaster a
                            WHERE a.scheme_mst_id IN (96,97,98,99,100,101,102,103))
ORDER  BY cv.new_ac_number, cv.transaction_date, cv.cumvouch_det_id;
SPOOL OFF

-- MF_04: the Mega Farm balance history, the same way if it is also large
SET SQLFORMAT csv
SPOOL C:\exports\MF_04_balance_history.csv
SELECT b.*
FROM   account_balance b
WHERE  b.new_ac_number IN (SELECT a.new_ac_number FROM acmaster a
                           WHERE a.scheme_mst_id IN (96,97,98,99,100,101,102,103))
AND    b.transaction_date = LAST_DAY(b.transaction_date)
ORDER  BY b.new_ac_number, b.transaction_date;
SPOOL OFF

SET SQLFORMAT default

Notes
- SQLFORMAT csv writes a header row, quotes strings and leaves numbers bare:
  the same shape as the other files.
- One SELECT per SPOOL block, one file each. Do not put two SELECTs between
  one SPOOL and SPOOL OFF.
- If the first line of the file repeats the SQL text, that is the worksheet
  echo: it does no harm, but SET ECHO OFF before SPOOL removes it.
- When done, open the file and check the LAST row is a complete quoted row,
  and send the row count with the file: the system's gates compare it with
  the manifest and refuse a short file rather than land it.
- Alternative for smaller results: Tools > Preferences > Database > Worksheet,
  raise "Maximum size of result set to store in memory (MB)" to 1000, re-run,
  then Export Data as usual.

===== RUN 0 - check the date format before exporting.txt
RUN 0 - CHECK THE DATE FORMAT BEFORE EXPORTING  |  Dupleix Institute  |  9 October 2026

Run these in the SAME SQL Developer worksheet (same connection tab) as the
queries. Each connection is its own session, so settings run in another tab
do not apply.

-- 1. Set the session (RUN 0 of the pack; lasts for this session only, changes nothing in the database)
ALTER SESSION SET NLS_DATE_FORMAT = 'YYYY-MM-DD HH24:MI:SS';
ALTER SESSION SET NLS_NUMERIC_CHARACTERS = '.,';

-- 2. Prove it took: the grid must show a date like 2026-10-09 11:14:05 and the number 1234567.89
SELECT SYSDATE AS today_as_text, 1234567.89 AS a_number FROM dual;

-- 3. Or read the settings themselves: expect YYYY-MM-DD HH24:MI:SS and .,
SELECT parameter, value
FROM   nls_session_parameters
WHERE  parameter IN ('NLS_DATE_FORMAT', 'NLS_NUMERIC_CHARACTERS');

If step 2 shows 09-OCT-26 or 10/9/2026, or 1234567,89, the settings are not
in force: run step 1 again in this worksheet and repeat step 2.

EXPORT: if the grid shows 2026-10-09 but the CSV still shows 10/9/2026, the
export dialog is re-formatting the date. Set it once and it sticks:
Tools > Preferences > Database > NLS > Date Format = YYYY-MM-DD HH24:MI:SS.

Then check the first data row of each CSV: a date column should read
"2026-09-30 00:00:00", not "9/30/2026".

Export settings for every file: CSV, header row, comma delimiter, strings in
double quotes, UTF-8, one file per query, named as the run sheet says.
===== pack 3 query list in repo:
```

```
72b495f Pack 3: the October month-end queries removed; they follow at month-end with current ids
513d0b8 Pack 3 queries to Barry, 9 October 2026 (M09_03, P2_13 re-run, Mega Farm, scheme master, table counts, term-loan
charges, the October month-end)
Query GL_03 - where the 22 year-end interest debits were posted - 8 Oct 2026.sql
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App

CLAUDE (2026-10-12 16:46:59 UTC)

The stray session files are cleaned up. The SICR tests pass: 17 tests, including the ones proving a trigger moves a loan to Stage 2 or Stage 3. Reviewing the staging-engine change before I commit it.

git commit -q -F - <<'EOF'
Qualitative SICR end to end: approved triggers lift the post-qualitative stage; a starter set of IFRS 9 qualitative factors

The staging engine now applies the approved entries of the SICR trigger register in force at each month-end
(QualitativeSicrService), matched on the contract or, for a customer-wide trigger, every loan of the customer: Stage 2 for a
significant increase in credit risk, Stage 3 for credit-impaired evidence (IFRS 9 B5.5.17, Appendix A). A trigger never moves a
loan down; the cure period runs from the month-end after a trigger ends. The engine no longer reads the ungoverned
loan_books.sicr flag; it writes it. The seeder adds 6 groups and 25 qualitative factors (forbearance, borrower condition,
agricultural and climate, external and market, behavioural, credit-impaired evidence), each with the stage it implies; the
bootstrap runs it. Tests prove the stage effect, expiry, customer-wide matching and the cure.

CLAUDE (2026-10-12 17:03:51 UTC)

This session is MAIIC, not EDF. The only thing from EDF today is a new file in their OneDrive folder: `Credit and Investments Policy_0001 (003).pdf`, 14 MB, uploaded at 16:10. There was no EDF email in Outlook. Gmail couldn't be checked because the connection failed.

Pack 3: what arrived, and whether it matters

All the files arrived complete: every row in every file has its full set of columns. Nobody has loaded them into any database yet.

```
| File | What it is | Matters? |
|---|---|---|
| **M09_03, Sep 2026 loan book runs** (550 rows) | E-Banker's Loan Book Report run for September 2026 | **Yes.** It's the next
month-end. With it the system can stage and calculate ECL for Sep 2026. |
| **MF_02 to MF_08, the Mega Farm book** (6,973 loans, 13,610 ledger rows, 80,121 monthly balances, status history, rates,
charges) | The whole Mega Farm programme | **Yes, for the Mega Farm module.** Today Mega Farm exists only as one November 2025
snapshot. |
| **SM_01, scheme master** (26 schemes) | Interest policy, floating flag and compounding for each scheme | Useful for the EIR
settings |
| **WO_01, CT_01, RS_01, CH_01** | Write-off, reschedule and charges tables | **Important:** they're all empty, as the
screenshot row counts confirm. E-Banker's write-off and reschedule tables hold no records. |
```

Two problems before the data can be loaded:

1. **Every date is in US format** (`9/30/2026`), not `2026-09-30`. The RUN 0 setting didn't carry through to the export, which is exactly what Barry's note warned could happen. The system's checks will refuse these files as they are. The date columns are consistently month-first, so they could be converted safely, but a clean re-export is better.
2. **Write-offs are recorded somewhere else.** E-Banker's write-off tables are empty, but MAIIC does write loans off, through status code **H**. On 29 Jun 2026, 38.5m in credits went to GL 1064. The IFRS 9 note currently reports write-offs as *nil* because it can't find a write-off marker, so **it understates write-offs**. The Mega Farm status history (MF_06) carries

those H codes, so this is fixable with this data.

Your colleague's session is on the **Pack 4** run sheet this morning: the large files split up, with row-count checks. I'd let them load Pack 3 and 4 together through the system's normal checks rather than load it from here and risk clashing with them.

Also finished

- **SICR qualitative factors work end to end, with tests:**
  - an approved trigger lifts a loan to Stage 2 (significant increase in credit risk) or Stage 3 (credit-impaired);
  - the cure period runs from the month-end after a trigger ends;
  - 6 groups and 25 factors are seeded;
  - 3 demo triggers took August's ECL to **11,314.6m**.
- □□ **Not pushed:** those last 2 commits are blocked because the GitHub login appears to have expired. Run `git push` in `C:\xampp\htdocs\MAICC-IFRS9`, or approve the GitHub sign-in window if one has appeared.

How the system works, and the client's month-end commands

The flow: E-Banker pack → checks (gates) → loan book built → staging (days past due + qualitative triggers) → PD and LGD per portfolio → forward-looking adjustment (approved fit × approved scenario set) → ECL → EIR revenue → reports → sign-off and lock. Every approval needs two different people (maker-checker), and every figure can be traced back through Audit Trace.

Once, on a new server:

```
php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify
```

After that, run `php artisan schedule:run` every minute (Windows Task Scheduler or cron). That covers the daily feed-folder check and the monthly macro data import.

Every month (Sep 2026 shown as the example):

```
| # | Step | Command (or screen) |
|---|---|---|
| 1 | Land the E-Banker pack | E-Banker Feed screen, or `php artisan eir:land-pack <folder> --user=<id>` |
| 2 | Build the loan book (a second person approves) | `php artisan eir:build-loan-books 2026-09` |
| 3 | Trial balance and any PLR change | `php artisan eir:import-trial-balances <folder>` · `php artisan
eir:import-reference-rates <file> --user=<id>` |
| 4 | Staging | `php artisan eir:stage 2026-09 --user=<id>` |
| 5 | PD and LGD per portfolio | `php artisan ifrs9:segment-parameters 2026-09 --user=<id>` |
| 6 | Scenarios (quarterly) | Scenario Sets screen, or `php artisan scenario:sets 2026-09 --seed`, then approve |
| 7 | Forward-looking adjustment | `php artisan fli:correlate 2026-09`, then propose and approve a fit on Regression (two
people), then `php artisan fli:apply 2026-09` |
| 8 | ECL | `php artisan ifrs9:segment-ecl 2026-09 --pd=pd_post_fli` |
| 9 | EIR revenue | `php artisan eir:run-revenue 2026-09 --user=<id>` |
| 10 | Mega Farm | `php artisan megafarm:ecl 2026-09 --user=<id>` |
| 11 | Review and close | Workspace checklist → Reports hub → management sign-off → `php artisan eir:lock-period 2026-09
--user=<id> --reason="Sep close"` |
```

Figures for the meeting: August ECL is **11.31bn**. That's per portfolio, after the forward-looking adjustment, and includes the 3 demo triggers. Every approval in the demo database is labelled "Demo, not a MAIIC approval".

Open points for Dr Thom:

1. Stage 1 PDs of 20% to 45% drive coverage above 40% before the forward-looking adjustment adds anything.
2. In April and July the pooled Stage 2 PD is below the Stage 1 PD.
3. The forward-looking adjustment rests on 19 to 26 monthly points of one driver, the PLR.
4. 57 loans carry E-Banker's default sector code 4290, so sector-level PDs can't be trusted yet.
5. Write-offs are recorded through status H, not E-Banker's write-off tables, so the IFRS 9 note shows them as nil.

I can also turn this rundown into a client document if that's useful.

USER (2026-10-13 07:02:27 UTC)

and now were did we end

CLAUDE (2026-10-13 07:03:53 UTC)

I'll check whether the last two commits have been pushed, so this summary is accurate.

Tool call: Bash

```
description: Check push status and new remote commits
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && timeout 60 git fetch -q origin 2>&1 | tail -1; git status -sb | head -1; git log --oneline -4
| cat; git log --oneline HEAD..origin/eir_revenue_recognition | cat; git status --short | grep -v "^??" | head
```

Result of Bash

```
## eir_revenue_recognition...origin/eir_revenue_recognition
5e02554 Review: Dr Thom's Mega Farm interest-split listing and the Deloitte 2025 ECL thread; effect on spec v4 (held until Dr
Thom answers)
cc9ff9d SICR screens: groups and items show the stage each factor implies; trigger alerts as a register with raised by,
evidence, dates and approval; Audit Trace shows the triggers a month ran under
1ed8f74 Qualitative SICR end to end: approved triggers lift the post-qualitative stage; a starter set of IFRS 9 qualitative
factors
8edaf60 Pack 4 run sheet: the RUN 8 count control renamed RUN 8a0, matching RUN 3h0
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-13 07:04:12 UTC)

Everything is pushed and in sync with GitHub. My two SICR commits went up, and your colleague has added a new commit on top: a review of Dr Thom's Mega Farm interest-split listing and the Deloitte 2025 ECL thread.

Where we ended

Done and live on `eir_revenue_recognition`**:**

- **Layout and screens:**
  - Your old MAIIC layout is back, with buttons top right and pages at full width.
  - The sidebar is TNM-style, with related pages grouped under one row of tabs showing real counts.
  - Every list shows 15 rows with page numbers.
  - Settings is cleaned up, messages appear in styled boxes, and every screen has been reworked.
- **Imports:** every import screen has instructions, a sample CSV, an upload button and its history.
- **Reports:**
  - Cut from 39 to 17, all checked against the database for Jul and Aug.
  - The IFRS 9 annual-report note is added.
  - The dashboard has a PDF export and an ECL build-up panel.
- **Forward-looking chain:**
  - Runs end to end with the as-at-date bug fixed.
  - The legacy tools are moved to Administration.
  - The correlation results read in plain English.
- **PD and LGD per portfolio,** with PD by sector and by RBM class in the reports.
- **The SICR qualitative factors** work end to end, with 25 factors seeded.
- **Loan Book and ECL table:** each loan's IFRS 9 trail (PD before FLI → adjustment → PD after FLI, LGD, EAD build-up, EIR).
- **The demo database (port 8050):** ECL runs for Jan to Aug 2026 per portfolio. **August ECL is 11.31bn.** Every approval is labelled "Demo, not a MAIIC approval".

Still open:

1. **Pack 3 isn't loaded yet.** It holds the Sep 2026 loan book, the full Mega Farm book and the scheme master. The dates are in US format, so they need a re-export or a safe conversion. Your colleague's session is on Pack 4, so it makes sense to load Packs 3 and 4 together.
2. **Write-offs.** MAIIC writes loans off through status code H, not E-Banker's write-off tables, so the IFRS 9 note reports write-offs as nil. This needs fixing once the status history is loaded.
3. **Sector codes.** 57 loans carry E-Banker's default code 4290, so ask Barry for the correct sectors.
4. **Model questions for Dr Thom:**
   - Stage 1 PDs of 20% to 45%.
   - Stage 2 PD below Stage 1 in some months.
   - The forward-looking adjustment rests on thin PLR data.
   - The fits list holds duplicate copies (a small code fix is still to do).
5. **Your offer still stands:** turning the month-end rundown into a client document.

What would you like next: the write-off fix, loading Pack 3, the duplicate-fits fix, or the client document?

USER (2026-10-13 07:08:37 UTC)

yes continue

CLAUDE (2026-10-13 07:08:44 UTC)

I'll continue with the items that won't clash with your colleague's Pack 3/4 work, in this order:

1. The duplicate-fits fix.
2. The write-off fix in the IFRS 9 note.
3. The month-end runbook as a client document.

I'll leave loading Packs 3 and 4 to your colleague's session.

Starting with the duplicate fits.

Tool call: Bash

```
description: Inspect how fits are written
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -n -E "analysis_runs|fli_fits|insertGetId|->insert\(|inputs_hash|function " app/Services/
Fli/RegressionEngine.php | head -40; "C:/xampp/mysql/bin/mysql.exe" -uroot -N maiic_ifrs9_demo -e "SHOW COLUMNS FROM fli_fits" |
 awk '{print $1}' | paste -sd' '
```

Result of Bash

CLAUDE (2026-10-13 07:09:12 UTC)

The fix works by recognising a repeat of an identical fit. Now a test proving a repeated sweep doesn't duplicate, then a careful clean-up of the duplicates already in the demo database.

dev/null && git commit -q -m "Regression engine: a re-sweep on the same data and governed guardrail settings reuses the
recorded fit instead of appending a copy

Every fli:correlate inserted a full second set of fits for the period, so the Regression list doubled (418 instead of about
209). The inputs hash now also covers the guardrail settings the verdict was reached under; an identical fit is reused, keeping
its approval; a changed observation or setting is recorded anew. Test added.

CLAUDE (2026-10-13 07:12:25 UTC)

The status history has no H events at all, so the account master is the only place H appears. Looking at what the master holds for those 21 accounts: dates and balances.

### 3.8 Status H, and the write-offs of 2026 (added 12 October 2026)

**In plain language.** Twenty-one loan accounts carry the status code H in E-Banker's account master. The status history says
they were paid up; the balances say they were not. In June 2026 Finance cleared what they still owed by a transfer into the
write-off account, which E-Banker recorded as a repayment. Read at face value, the ledger turns MWK 38.5 million of losses into
cash collected. This section sets out the evidence, what H means on it, and the rule the engine follows.

**What the records show.**

| Source | What it shows |
|---|---|
| Account master (`P1_02`) | 21 accounts with STATUS_CODE H, status reason "Paid Up", status dates 11 to 16 December 2025 (17
accounts) and 30 June 2026 (4) |
| Status history (`P3_13`) | No H row at all. Each of the 21 went from A to D "Paid Up" on those dates; the H is set in the
master without a history entry |
| Balance history (`P2_09`, `M09_02`) | The balances did not change between December 2025 and May 2026: Lenziemill Milling owed
5,667,578.18, COMSIV 8,318,966.49, Mwachisosa Women Producers 6,676,759.40, and so on. "Paid Up" was not a repayment |
| Ledger (`P1_01`) | On 29 June 2026 one batch, TRF 3, credited MWK 38,492,032.54 to 20 of the accounts, type 305 (the
repayment type), narrated "ACCOUNT CLOSURE"; no leg of the batch is on another loan account |
| Trial balance (Finance) | GL 1064 Term Loans Write Offs rose by exactly 38,492,032.54 between May and June 2026 |
| E-Banker manual (section 7.4) | A genuine account closure is posted with batch type ACCLO; this batch was a TRF transfer |
| Finance's loan books | All 21 accounts carry balances in the May 2026 loan book and are nil from June 2026 |

**What H means.** On this evidence H marks an account **written off and closed**. Finance has been asked to confirm (section
5). The other codes, for the record: A active; C closed (15 of the 46 are UAT test accounts); D closed, with the reason in the
history (paid up, foreclosure, lapsed); F seen on the accounts whose balance was re-booked to another account (The Food Empire
Limited, moved from MAIIC Agricultural to FInES in December 2025 and to a term loan in May 2026, each move a closure credit
matched by an equal debit on the next account).

**Three accounts the batch did not settle cleanly.** Imani Investments (000104460000061): the transfer, 1,102,536.37, exceeded
what was owed, and the account is **in credit by 861,723.83**. Tac-Maz Investment (000104450000038): 37,291.56 is still owed
after the transfer and interest is still charged monthly. Perisha Agro and Packaging (000104450000030): not in the batch; 1,
513.12 still owed.

**The write-off account over time.**

| When | GL 1064 movement | What it is | Loans |
|---|---:|---|---|
| 31 August 2024 | 22,286,434.32 | Two write-offs posted as type 300 | Micholess Creameries, Maluso Cooperative |
| January 2026 | 138,135,680.80 | Debit 1064, credit 1876 ECL Write Offs: a memorandum pair; **no loan account moved** | Not
identified (asked of Finance, section 5) |
| 29 June 2026 | 38,492,032.54 | TRF 3, type 305 on the loans, debit 1064 | The 20 H accounts above |

The write-off tables of E-Banker (LOAN_WRITEOFF_MASTER, LOAN_WRITEOFF_TRANS) are empty (CT_01), so the GL and the ledger are
the only record. Of the three, only the 2024 write-offs carry the write-off transaction type.

**The rule the engine follows.** A credit to a loan account is a **write-off, not a collection**, when any of these holds: its
transaction type is 300; it sits in a batch whose other leg is GL 1064 (read from `GL_05`, below, and later from the monthly
ledger); or it is narrated "ACCOUNT CLOSURE" in a TRF batch on an account whose status is H. The loan book build (method B)
records it as written off; the LGD engine counts the amount as a loss, not a recovery, and does not treat the account as
settled; the EIR stops at the write-off date with the written-off amount as derecognition, not cash received; the RBM return
shows it as written off. An account in credit after a write-off (Imani) is reported as a liability to the customer, not as
negative exposure. Status H is mapped to written off in the engine's status table, and D "Paid Up" is not taken as evidence of
repayment unless the balance went to nil by cash.

**What is asked for.** `GL_05` (pack 4, RUN 7): every leg of batch TRF 3 of 29 June 2026, and every posting to 1064 and 1876 in
January 2026, in the same shape as `GL_03`. Finance: the confirmation that H means written off, the loans behind the January
2026 entry of 138,135,680.80, and what is to be done about Imani's credit and Tac-Maz's residual.

Result of Bash

```
**Every month, by the feed.** Barry runs the versioned queries (Data Foundation, E-Banker Feed, "Download the queries"), zips
the CSV files with `manifest.json`, and uploads the zip on the same screen (route 1); the gates run and the pack is landed or
quarantined with the file and row named. Then a build is proposed for the month and a second person approves it; the
differences from the previous build are shown first and a locked period (`php artisan eir:lock-period <YYYY-MM> --user=<id>
--reason="..."`) is never restated. The engines run from their screens or by the commands above.

**The EIR at any date.** `php artisan eir:as-at <YYYY-MM-DD> [--contract=<id>]`, or Report Hub, EIR as at a Date: a month-end
reads the locked roll-forward row; a date inside a month accrues the EIR on the actual days from the prior month-end less the
cash received; a date after the last loaded posting is refused with that date named.

**Interim scripts.** The Python scripts under `docs/build-files/` (`demo_load_loan_books.py`, `demo_contract_master.py`,
`demo_schemes.py`, `demo_stage.py`) were the interim load of the 8 October demo and are kept as a record; the bootstrap
replaces them.

CLAUDE (2026-10-13 07:13:16 UTC)

I've confirmed every command's exact options. Now writing section 9.9 into the Installation Guide.

Tool call: Bash

```
description: Add section 9.9 month-end run to the installation guide
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && cat >> docs/manuals/installation/09-data-loading.md <<'EOF'

### 9.9 The month-end run, in order (from 12 October 2026)

Section 9.8 describes the one-off bootstrap. Every month-end after that follows the steps below, in this order, for the month
being closed (September 2026 in the examples). Each step can be run from its screen or by the command shown; a step that lacks
its input refuses with the reason named rather than writing a partial result. Anything that changes a governed figure (a loan
book build, a fit, a scenario set, a qualitative trigger, an overlay) is proposed by one person and approved by another.

| # | Step | Screen | Command |
|---|---|---|---|
| 1 | Land the E-Banker pack (dates in `yyyy-mm-dd`, row counts in the manifest) | Customer & Loan Data, Imports & Feeds,
E-Banker Loads | `php artisan eir:land-pack <folder> --user=<id>` (route 2: the scheduler polls the feed folder at 06:30 each
day) |
| 2 | Build the month's loan book; a second person approves | Imports & Feeds, Loan Book Builds | `php artisan
eir:build-loan-books 2026-09` |
| 3 | Trial balance and any change to the prime lending rate | Imports & Feeds; EIR Data, Reference Rates | `php artisan
eir:import-trial-balances <folder>`; `php artisan eir:import-reference-rates <file> --user=<id>` |
| 4 | Raise or close qualitative SICR triggers for the month (watch-list, restructuring, drought, covenant breach...) | IFRS 9
Model Setup, Staging & SICR Rules, SICR Trigger Alerts | (screen only, maker-checker) |
| 5 | Stage the book: days past due against the governed thresholds, the missed-instalment trigger, then the approved
qualitative triggers | Staging & SICR Rules | `php artisan eir:stage 2026-09 --user=<id>` |
| 6 | PD and LGD by segment on the governed basis (Governance Centre, PD & LGD segments) | PD Model; LGD Model | `php artisan
ifrs9:segment-parameters 2026-09 --user=<id>` |
| 7 | Scenario set for the period (quarterly, or when the outlook changes): seed, review, approve, lock | Scenarios & Overlays,
Scenario Sets | `php artisan scenario:sets 2026-09 --seed`, then approve on the screen |
| 8 | Forward-looking model: the correlation sweep as at the month-end, a fit proposed and approved, the route applied to every
loan | Forward-Looking Model, Correlation Finder and Regression (FLI Adjustments) | `php artisan fli:correlate 2026-09`;
propose and approve the fit on the Regression screen; `php artisan fli:apply 2026-09 --user=<id>` |
| 9 | Expected credit loss for every portfolio, on the post-FLI PD | ECL Processing, ECL Calculation | `php artisan
ifrs9:segment-ecl 2026-09 --pd=pd_post_fli` |
| 10 | EIR revenue roll-forward | EIR & Revenue Recognition, EIR Calculations | `php artisan eir:run-revenue 2026-09
--user=<id>` |
| 11 | Mega Farm programme | ECL Processing, Mega Farm Programme | `php artisan megafarm:ecl 2026-09 --user=<id>` |
| 12 | Review: the Workspace close checklist, the dashboard (ECL build-up), the Reports hub (IFRS 9 note, RBM return,
reconciliations) | Workspace; Dashboard; Reports | (screens) |
| 13 | Management sign-off and the period lock: no later build restates a locked month | Workspace | `php artisan
eir:lock-period 2026-09 --user=<id> --reason="September 2026 close"` |

**Order matters.** A new PD run (step 6) clears the post-FLI PD of the month, because that PD was built on the old one; steps 8
and 9 must follow it. Re-staging a month (step 5) likewise requires steps 6, 8 and 9 again. The ECL run (step 9) refuses when
any loan with exposure has no stage, PD or LGD, and names the loans.

**The scheduler.** Run `php artisan schedule:run` every minute (Windows Task Scheduler or cron, chapter 7). It polls the
E-Banker feed folder each morning and imports the World Bank macro series on the second day of each month.

**Before a month is presented.** The forward-looking result rests on a short history (the PLR against the Stage 3 share, about
two years of monthly data); the segment PDs on small portfolios take the pooled book's PD under the governed thin-segment rule,
recorded per cell; sectors coded 4290 by E-Banker are held apart as an unverified default code; write-offs follow specification
v4 section 3.8 (status H and the 29 June 2026 transfer to GL 1064).

Segmented PD and LGD, the governed forward-looking route, ECL per portfolio, the qualitative SICR register, the lock; the order
rules (a new PD run clears the post-FLI PD), the scheduler, and what to state before a month is presented.

CLAUDE (2026-10-13 07:14:01 UTC)

I made two changes and pushed both. One item needs your OK.

Done and pushed:

1. **Duplicate fits fix.** Re-running the correlation sweep on the same data no longer adds a second copy of every fit. It reuses the fit already recorded, keeping its approval. If the data or the governed guardrail settings change, a new fit is still recorded. A test proves it.
2. **Month-end runbook for the client.** It's new section **9.9 of the Installation Guide**, which is already a contract deliverable, so there's one source of truth instead of a separate document. It lists the 13 steps in order, each with its screen and exact command: land the pack, build the loan book, trial balance and PLR changes, SICR triggers, staging, PD and LGD by segment, scenarios, the forward-looking adjustment, ECL, EIR revenue, Mega Farm, review, then sign-off and lock. It also covers the ordering rules (a new PD run means the forward-looking adjustment and ECL must be re-run) and the scheduler. It shows under System Documentation → Installation Guide.

Needs your OK: deleting the **826 duplicate fits already in the demo database**. The system blocked the bulk delete pending your approval, which is right.

- **Remove:** only unapproved copies that no loan points to.
- **Keep:** every approved or proposed fit, plus one copy of each identical set.
- **Backup:** the table is in OneDrive (`maiic_ifrs9_demo_fli_fits_pre-dedupe_2026-10-13.sql.gz`).

The result would be about 2,500 fits instead of about 3,300, and the Regression list stops showing doubles. **Reply "yes, delete the duplicates" and I'll run it.**

Write-offs: left with your colleague's workstream, on purpose. Their session wrote the rule into spec v4 section 3.8 yesterday:

- **What H means:** it marks an account written off, even though its reason says "Paid Up".
- **The 29 Jun 2026 transfer:** the 38.49m into GL 1064 is a write-off, not cash collected.
- **The money:** 22.3m written off in 2024, plus a 138.1m January 2026 entry that Finance still has to explain.

It waits on **GL_05 in Pack 4** and on Finance confirming what H means. Once their loan-book build marks write-offs, the IFRS 9 note will read that marker in place of "nil". Building it separately now would clash with their work.

Still open on the MAIIC side:

- Loading Packs 3 and 4 (your colleague's session).
- Barry's re-export with ISO dates and the correct sector codes.
- The model questions for Dr Thom.

USER (2026-10-13 07:22:27 UTC)

yes continue

CLAUDE (2026-10-13 07:24:30 UTC)

You've said yes, so I'm removing the duplicate fits now. The table is backed up, and only unapproved copies that no loan uses will go.

Tool call: Bash

```
description: Remove unapproved duplicate fits after user approval
--- command ---
M="C:/xampp/mysql/bin/mysql.exe"; "$M" -uroot -N maiic_ifrs9_demo -e "
CREATE TEMPORARY TABLE keepers AS
SELECT fli_relationship_id r, reporting_period p, slope s, intercept i, n_obs n, r_squared q,
  COALESCE(MIN(CASE WHEN approval_status='APPROVED' THEN id END), MIN(CASE WHEN approval_status='PROPOSED' THEN id END),
MIN(CASE WHEN COALESCE(approval_status,'NONE')<>'NONE' THEN id END), MIN(id)) keep_id
FROM fli_fits GROUP BY fli_relationship_id, reporting_period, slope, intercept, n_obs, r_squared;
DELETE f FROM fli_fits f JOIN keepers k ON k.r=f.fli_relationship_id AND k.p=f.reporting_period AND k.s=f.slope AND
k.i=f.intercept AND k.n=f.n_obs AND k.q=f.r_squared
WHERE f.id<>k.keep_id AND COALESCE(f.approval_status,'NONE')='NONE' AND f.id NOT IN (SELECT DISTINCT fli_fit_id FROM loan_books
WHERE fli_fit_id IS NOT NULL);
SELECT 'removed', ROW_COUNT();
SELECT 'remaining', COUNT(*) FROM fli_fits;
SELECT 'approved', COUNT(*) FROM fli_fits WHERE approval_status='APPROVED';

duplicate groups left    1
approved    8
loans pointing to a missing fit    0
202608    210
202607    285
202606    285
```

CLAUDE (2026-10-13 07:25:18 UTC)

The clean-up is done.

- **Removed:** 1,139 unapproved duplicate fits. 827 went in the first pass. The other 312 were declined fits with blank statistics, which my first comparison missed.
- **Kept:** all 8 approved fits and every proposed or rejected one. No loan points to a missing fit.

- **August 2026:** 210 fits (the expected ~209 plus the approved one), down from 418. The Regression list no longer shows doubles.
- **One group still has two copies:** an approved fit and its rejected twin. That's deliberate, because each carries a different decision on record.
- **Backup:** the table is in OneDrive (`maiic_ifrs9_demo_fli_fits_pre-dedupe_2026-10-13.sql.gz`).

The code fix pushed earlier stops new duplicates, so a re-run won't refill the list.

Everything in my scope for MAIIC is now done and pushed. What's left needs other people:

- **Your colleague's session:** loading Packs 3 and 4, and the write-off rule in spec section 3.8, which waits on GL_05.
- **Barry:** a re-export with ISO dates, and the correct sector codes for the 57 loans on 4290.
- **Finance:** confirmation that status H means written off, and an explanation of the 138.1m January entry.
- **Dr Thom:** the high Stage 1 PDs, Stage 2 PD below Stage 1 in some months, and the thin data behind the forward-looking adjustment.

USER (2026-10-13 07:39:18 UTC)

start the system for me let me see what u have been doing

CLAUDE (2026-10-13 07:40:23 UTC)

Checking what's running, then I'll start the system and open it in your browser.

Tool call: Bash

```
description: Check servers, database and build state

CLAUDE (2026-10-13 07:41:34 UTC)

MAIIC is running at **http://127.0.0.1:8050**, and I've opened the dashboard in your browser. It's on the demo database (`maiic_ifrs9_demo`) with the latest code and freshly built screens. Sign in as `admin@localhost.com` with your usual password.

Where to look:

1. **Dashboard:** pick **Aug 2026**. The ECL build-up panel runs from ECL before FLI to the forward-looking effect to overlays to booked ECL. "Where the ECL sits" switches between product group, sector and RBM class. Download dashboard (PDF) is top right.
2. **Sidebar:** coloured icons, guide lines, and related screens grouped under one tab row with real counts. Try **EIR & Revenue Recognition → EIR Data**, which shows its tabs in workflow order.
3. **Customer & Loan Data → Loan Book:** open any row to see that loan's IFRS 9 trail (PD before FLI, adjustment, PD after FLI, LGD, EAD build-up, EIR, and the fit it ran under).
4. **ECL Processing → ECL Calculation:** how the ECL was built for each loan, with totals.
5. **Reports:** the hub with 17 reports in six groups. Look at the **IFRS 9 note for the annual financial statements**, and **RBM classification & provisioning** with PD by RBM class.
6. **IFRS 9 Model Setup:**
   - **Staging & SICR Rules:** the 25 qualitative factors and the 3 demo triggers.
   - **PD Model:** open a matrix to see the new pop-up.
   - **Forward-Looking Model:** plain-English correlations and the approved fit card.
   - **Scenario Sets:** scenario cards and sensitivity.
7. **Governance Centre → PD & LGD segments:** the governed PD basis and the thin-segment rule.
8. **Imports & Feeds:** E-Banker loads, builds and periods in one tab row, plus import screens with instructions and sample CSVs.
9. **Administration → Legacy FLI tools,** and **System Documentation → Installation Guide → section 9.9**, the month-end run.

The server is a background task here, so it stops after about 2 hours or if this session closes. To restart it yourself, run this in `C:\xampp\htdocs\MAICC-IFRS9`:

```
php -S 127.0.0.1:8050 -t public server.php
```

USER (2026-10-13 07:41:52 UTC)

this is not the maic page login that was there what have u done

CLAUDE (2026-10-13 07:41:58 UTC)

I didn't touch the login page, and none of my agents was given it. But I'll check the history rather than assume.

CLAUDE (2026-10-13 07:43:14 UTC)

I was wrong: my first search pattern was faulty, and the stylesheet is fine. All the screen-size styles are there. So I'll look at the page the way a browser sees it, at desktop width.

Tool call: Bash

```
description: Screenshot the login page at desktop widths
--- command ---
T="C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/scratchpad/
tools"; cat > "$T/shot_login.cjs" <<'EOF'
const puppeteer = require('C:/xampp/htdocs/MAICC-IFRS9/node_modules/puppeteer');
(async () => {
  const b = await puppeteer.launch({ headless: 'new' });
  for (const w of [1707, 1280]) {
    const p = await b.newPage();
    await p.setViewport({ width: w, height: 900 });
    const errs = []; p.on('console', m => { if (m.type()==='error') errs.push(m.text()); }); p.on('pageerror', e =>
errs.push(e.message));
    await p.goto('http://127.0.0.1:8050/login', { waitUntil: 'load', timeout: 60000 });
    await new Promise(r => setTimeout(r, 2500));
    await p.screenshot({ path: process.argv[2] + '/login_' + w + '.png' });
    const vis = await p.evaluate(() => { const el = document.querySelector('h1'); return el ?
getComputedStyle(el.closest('div.relative.hidden') || el).display + ' | ' + el.innerText.slice(0,30) : 'no h1'; });
    console.log(w, vis, JSON.stringify(errs.slice(0,3)));
  }
  await b.close();
})();

CLAUDE (2026-10-13 07:44:11 UTC)

I've sent you a screenshot of the sign-in page as the server is serving it now. It's the usual MAIIC page: logo and "Investing in Potential. Building Futures." on the left, and the sign-in card on the right.

Your Edge tab shows only the card because the page hides the left panel when the window is narrow or zoomed in. Press **Ctrl + 0** in that tab to reset the zoom, then **Ctrl + F5** to reload, and the left panel should come back.

If it still shows only the card after that, send me a screenshot and I'll look again.

USER (2026-10-13 07:51:52 UTC)

it still showing thids

CLAUDE (2026-10-13 07:54:37 UTC)

The reload didn't help, so this isn't a zoom problem. My test browser at your screen width shows the full page, but your Edge doesn't. Checking whether more than one server is answering on port 8050, for example an older one from before today.

Tool call: PowerShell

```
description: List every process listening on port 8050
--- command ---
Get-NetTCPConnection -LocalPort 8050 -State Listen -ErrorAction SilentlyContinue | ForEach-Object { $p = Get-CimInstance
Win32_Process -Filter "ProcessId=$($_.OwningProcess)"; "{0} pid={1} started={2} cmd={3}" -f $_.LocalAddress, $_.OwningProcess,
$p.CreationDate, $p.CommandLine }
```

Result of PowerShell

```
127.0.0.1 pid=37740 started=10/13/2026 9:41:23 AM cmd=C:\xampp\php\php.exe -S 127.0.0.1:8050 -t public server.php
```

USER, sent while Claude was working (2026-10-13 07:52:28 UTC)

its okay now

CLAUDE (2026-10-13 07:54:47 UTC)

The sign-in page looks right now. Only one server is running on port 8050, and it's the one I started this morning. Your Edge was most likely still showing the page from before you reset the zoom.

Sign in and go through the tour from my earlier message. Start with the **Dashboard on Aug 2026**, then open a row on the **Loan Book**. Send me a screenshot of anything that looks wrong.

USER (2026-10-13 08:09:47 UTC)

CLAUDE (2026-10-13 08:12:37 UTC)

I've reordered the dashboard and pushed it. Refresh to see the new order:

1. Figure cards
2. Stage 1, 2 and 3 cards

3. Charts: Exposure by stage, and ECL and coverage trend
4. ECL build-up, and Where the ECL sits
5. Portfolio summary, then the month-end status, latest loan book and recent imports

I haven't changed the **Download dashboard (PDF)** button yet; I'm waiting for your example. Send the screenshot of how you'd like it to look and I'll match it.

USER (2026-10-13 08:13:07 UTC)

CAN WE ADD a mainatanance page wcallows u sto run bootstrap commands by clicking in the ui for the first time as we did on the stress testing app and tell me if the fli we used to do is now stored as legacu fli, where is the cuureent fli now in the system . I haven't changed the Download dashboard (PDF) button yet; I'm waiting for your example. Send the screenshot of how you'd like it to look and I'll match it, just amke it nice and smaller its too big

CLAUDE (2026-10-13 08:13:15 UTC)

Three things:

1. Make the PDF button smaller and neater.
2. Answer the forward-looking question.
3. Build a Maintenance page like the Stress Testing app's.

Starting with the button.

Tool call: Bash

```
description: Make the PDF button a small gold pill
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && python - <<'PYEOF'
p='resources/js/Pages/Dashboard.vue'
s=open(p,encoding='utf-8').read()

CLAUDE (2026-10-13 08:14:14 UTC)

I'm writing the Maintenance console now: first the command runner service, which ports the Stress Testing app's background runner.

Tool call: Bash

```
description: Port the command runner with a one-at-a-time check
--- command ---
mkdir -p /c/xampp/htdocs/MAICC-IFRS9/app/Services/Maintenance && cp /c/xampp/htdocs/Stress-Testing-App/app/Services/Maintenance/
CommandRunner.php /c/xampp/htdocs/MAICC-IFRS9/app/Services/Maintenance/CommandRunner.php && cd /c/xampp/htdocs/MAICC-IFRS9 &&
python - <<'PYEOF'
p='app/Services/Maintenance/CommandRunner.php'
s=open(p,encoding='utf-8').read()
# add a "is anything running" helper, used to allow one run at a time
old="""    private function stripAnsi(string $s): string"""
new="""    /** The run still in progress, if any: one maintenance command at a time. */
    public function running(): ?array
    {
        foreach ($this->recent(10) as $r) {
            if (($r['status'] ?? '') === 'running') {
                return $r;
            }
        }

        return null;
    }

    private function stripAnsi(string $s): string"""
assert s.count(old)==1; s=s.replace(old,new)
s=s.replace("a small launcher script, fires it detached", "a small launcher script, fires it detached (ported from the Stress
Testing app's console)")
open(p,'w',encoding='utf-8',newline='').write(s); print('ok')
PYEOF
php -l app/Services/Maintenance/CommandRunner.php | tail -1; grep -c "storage/app/command-runs\|command-runs" .gitignore
storage/app/.gitignore 2>/dev/null
```

Result of Bash

```
ok
No syntax errors detected in app/Services/Maintenance/CommandRunner.php

CLAUDE (2026-10-13 08:20:23 UTC)

The page and the live output work. The output wraps messily because the commands pad their lines for a terminal, so I'll keep each line whole and let it scroll sideways. Then I'll commit.

Tool call: Bash

```
description: Fix output wrapping, build, commit and push
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -i 's/class="flex-1 overflow-auto whitespace-pre-wrap bg-gray-950/class="flex-1
overflow-auto whitespace-pre bg-gray-950/' resources/js/Pages/Admin/Maintenance.vue && grep -c "whitespace-pre bg-gray-950"

CLAUDE (2026-10-13 08:21:44 UTC)

I've done the button and the maintenance page, and pushed both. Refresh to see them.

1. PDF button: it's now a small gold "PDF" pill with a file icon, sitting beside the filters, and it downloads the same dashboard PDF.

2. Maintenance page: it's under Administration → Maintenance, and works like the Stress Testing app's console. You click Run and a panel on the right shows the command's live output. I tested it: "System snapshot" ran and finished in 3 seconds.

- **First-time setup** (numbered):
  1. Bootstrap the system. It's red and **wipes and rebuilds the database**, so the Run button stays disabled until you type **BOOTSTRAP**, and then it asks once more.
  2. Apply database updates.
  3. Refresh roles and permissions.
  4. Add missing governance defaults.
  5. Seed the qualitative SICR factors.
- **Month-end:** pick a month from the dropdown, then run the 8 steps in order. These are build the loan book, stage, PD and LGD by segment, forward-looking sweep, apply the approved fit, ECL, EIR revenue and Mega Farm. The dropdown offers the months that have loan books, plus the next month so you can build it.
- **Imports:** the World Bank macro series, and new E-Banker packs from the feed folder.
- **Diagnostics** (read-only): system snapshot, database update status, golden-number check, report smoke test.
- **Run history:** who ran what, when, how long it took and the result, with each output viewable.
- **Safety:**
  - The browser can only choose from the fixed list and a validated month, so nothing typed reaches the system's command line.
  - Only one command runs at a time.
  - Every run is written to the audit log.
  - Anyone with settings access can open the page, but only an admin can run commands.

3. Where the forward-looking (FLI) work lives now:

- **The old FLI** is under **Administration → Legacy FLI tools**: Weighted Forecast, Credit Loss Data, Adjusted Forecast, Scenario Profiles, Economic Scenarios, External Calculations and History. Each opens with a notice that it isn't used by the ECL. External Calculations can no longer write to the loan book.
- **The current FLI**, the one that feeds the ECL, is under **IFRS 9 Model Setup**, in this order:
  1. **Macro Statistics:** the economic series and their sources.
  2. **Forward-Looking Model → Correlation Finder:** which series, at what lag, explain MAIIC's credit losses.
  3. **Forward-Looking Model → Regression (FLI Adjustments):** the fits. One is proposed and a second person approves it, and the approved fit shows as a card at the top.
  4. **Scenarios & Overlays → Scenario Sets:** base, upside, downside and severe, with their weights, approved and locked.
  5. **Scenarios & Overlays → Manual Overlays:** judgement adjustments, approved and time-limited.

The approved fit and scenario set are then applied to every loan as its post-FLI PD, and the ECL runs on it. You can follow one loan's trail by opening its row on the Loan Book, and the effect on the total shows in the dashboard's **ECL build-up** panel.

USER (2026-10-13 08:25:17 UTC)

what do u think about this ets do a spec document for that

<pasted_content id="88ea">

Designing a Complete IFRS 9 Forward-Looking Information (FLI) Module for MAIIC Bank

For a bank such as MAIIC in Malawi, I would design Forward-Looking Information (FLI) as a fully integrated, auditable modelling module within the IFRS 9 system, rather than a page where users simply upload GDP, inflation and other macroeconomic variables and enter an adjustment percentage.

The objective is to allow the bank to perform its IFRS 9 calculations every month, review and update its economic outlook, conduct a comprehensive annual model review, and retain the complete history of what was used to calculate each reporting period's Expected Credit Loss (ECL).

Because your system already calculates Effective Interest Rates (EIR) and discounts expected repayments, FLI must connect directly to the bank's PD, LGD, EAD and expected-cash-flow calculations without incorrectly changing the EIR or double-counting credit losses.

1. What IFRS 9 actually requires

IFRS 9 paragraph 5.5.17 requires Expected Credit Loss to reflect three fundamental elements:

1. An unbiased, probability-weighted amount considering possible outcomes.
2. The time value of money.
3. Reasonable and supportable information about historical events, current conditions and future economic forecasts.

Importantly, IFRS 9 does not prescribe a particular statistical model, a fixed number of economic scenarios, or a universal FLI adjustment formula. Those are modelling choices the bank must support, validate and document.

[image](https://www.google.com/s2/favicons?domain=https://www.ifrs.org\&sz=32)

IFRS

+2

For MAIIC, I would use this architecture:

Proposed IFRS 9 calculation architecture

Macroeconomic Data & Forecasts

GDP, inflation, policy rates, exchange rates and relevant sector indicators

Baseline

50%

Upside

20%

Downside

30%

Illustrative scenario weights only — bank-approved probabilities required

FLI Transmission Models

Translate macroeconomic forecasts into future portfolio credit risk

PD & Staging

LGD / Recoveries

EAD / Utilisation

Scenario-Level ECL Calculation

Expected contractual cash shortfalls discounted using the applicable IFRS 9 EIR

Probability-Weighted Final ECL

Saved with the reporting period, model versions, scenario assumptions, approvals and audit trail

The most important distinction is that FLI changes expectations about credit risk and cash recoveries, while EIR determines the discounting of the resulting cash shortfalls.

You should therefore build FLI and EIR as connected but separately controlled calculation services.

2. How frequently the bank should perform FLI

I would separate annual modelling from monthly ECL processing.

```
| Activity                 | Frequency                                                    | How it should work
   |
| ------------------------ | ------------------------------------------------------------ |
------------------------------------------------------------- |
| Economic data updates    | Monthly or when new data becomes available                   | Import published actuals and
revised forecasts                  |
| Scenario review          | Every reporting month                                        | Confirm that existing forecasts
and weights remain appropriate     |
| FLI model recalibration  | At least annually, plus event-driven                         | Re-estimate macroeconomic
relationships and test model performance |
| FLI scenario approval    | Each new or materially revised scenario set                  | Risk/Finance review with
maker-checker approval                    |
| ECL calculation          | Every month-end                                              | Use approved FLI assumptions
applicable to that date              |
| EIR calculation          | Origination, with required subsequent accounting adjustments | Preserve original EIR and
```

```
applicable rate history                  |
| EIR-based ECL discounting | Every ECL run                                              | Discount future cash shortfalls to
reporting date                  |
| Backtesting               | Monthly monitoring, deeper annual validation               | Compare earlier forecasts with
actual outcomes                       |
```

One crucial point: the bank should not automatically reuse January's forecasts for December without evaluating whether they remain reasonable at December's reporting date.

Monthly ECL calculations should always reference an approved, reporting-date-appropriate economic outlook, even if the bank decides that an existing forecast set remains suitable.

3. How I would design the FLI module user interface

I would introduce a separate top-level Forward-Looking Information menu in the IFRS 9 system.

Rather than putting everything on one very long page, I would use a dashboard, a guided scenario workbench and a set of dedicated modelling screens.

Proposed navigation

Base, upside and downside

Current forecast vintage

2026-10 v1

Approval and publication tracked

Month-end controls

Data completeness → Model validation → Scenario approval → ECL run

The individual screens should work as follows.

Screen A — Economic Indicators

This is where bank users manage macroeconomic information from sources such as the Reserve Bank of Malawi, National Statistical Office, IMF and World Bank.

It should support importing both historical actuals and future forecasts, but maintain a clear distinction between them.

Example data table (all values below are illustrative, not actual Malawi forecasts):

Indicator	2024 Actual	2025 Actual	2026 Forecast	2027 Forecast
Real GDP growth	2.0%	2.5%	3.2%	4.1%
Inflation	27.0%	23.0%	20.0%	16.0%
Policy rate	26.0%	25.0%	23.0%	21.0%
Exchange rate change	18.0%	14.0%	12.0%	9.0%

Every observation should include its source, release date, reporting period, unit, observation type (actual, estimate or forecast), and the date it became available to the bank.

That last requirement is important for historical reproducibility. A forecast published in October 2026 must not silently replace the forecast that was actually available when the bank closed its accounts in March 2026.

The UI should offer Excel/CSV import, manual entry, validation, historical charts, source-document attachments and revision comparisons.

Screen B — Scenario Workbench

This is where the bank constructs future economic conditions.

Here is an interactive example of how I would organize that screen. The percentages and FLI impacts are simulated to demonstrate the design, not MAIIC model outputs.

Scenario Workbench

Economic assumptions and scenario probabilities

Draft simulation

Reporting periodOctober 2026

Forecast horizon

2026–2028

Scenario probabilities

Upside

20%

Baseline

50%

Downside

30%

Total probability

100%

Economic scenario forecasts

UpsideBaseDownside

Indicator	2026	2027	2028
GDP growth	3.2%	4.1%	4.5%
Inflation	20.0%	16.0%	13.0%

This interactive prototype is for exploring the interface. It does not save changes to a bank database or calculate a validated FLI model.

In the actual system, I would also include monthly forecasts, charts comparing scenario trajectories, an economic rationale field, forecast-source attachments and model-generated scenarios that can be reviewed before approval.

Users must be able to save drafts without affecting previous approved forecasts.

Screen C — Model Calibration

This is arguably the most important screen.

Many IFRS 9 implementations do not model the statistical relationship between economic conditions and credit defaults adequately. Instead, they apply an arbitrary PD uplift.

The screen should allow the bank to examine how macroeconomic variables affect credit risk, for example by estimating:

\\[\operatorname{logit}(PD_{s,t}) = \beta_0+\beta_1 GDP_{s,t} +\beta_2 Inflation_{s,t} +\beta_3 Rate_{s,t} \\]

Here \\(s\\) represents the scenario and \\(t\\) the forecast period.

This is an example of a possible model specification, not a prescribed IFRS 9 formula. The bank could instead use a transition-matrix model, survival model, satellite model, calibrated multipliers or another validated method.

I would design the calibration page around three panels:

- Data selection: choose portfolio, historical default observations, macroeconomic variables, date range and lags.
- Model evaluation: coefficients, confidence intervals, predictive accuracy, economic plausibility, stability, backtesting results and diagnostic tests.
- Model publication: version, effective date, validation documents, approval and whether it is authorized for production ECL.

For example:

Model	Portfolio	Proposed macro drivers	Status
PD-FLI-01	Retail loans	GDP, inflation	Example only
PD-FLI-02	SME loans	GDP, rates, FX	Example only
LGD-FLI-01	Secured loans	Collateral prices, recovery conditions	Example only

The choice of macroeconomic variables must be justified by historical evidence, economic reasoning and the portfolio's risk characteristics.

Importantly, the system should support segment-specific model configurations rather than assuming the same GDP sensitivity across every loan type.

Screen D — FLI Impact Analysis

Before approving new assumptions, users should compare the current proposed FLI output with the previously approved assumptions.

FLI Impact Analysis

Simulated values

ECL before FLI

MWK 10.00bn

Weighted ECL after FLI

MWK 11.95bn

+19.5%

0bn5bn10bn15bn20bnUpsideBaseDownside

Illustrative ECL amounts in MWK billions; not actual bank results.

Upside (20%)	MWK 8.00bn
Base (50%)	MWK 11.00bn
Downside (30%)	MWK 16.00bn
Probability-weighted	MWK 11.90bn

Scenario-weighted result: (8 × 20%) + (11 × 50%) + (16 × 30%) = MWK 11.90bn. The simulated summary above should therefore display MWK 11.90bn and +19.0%; the independently illustrative summary figures are not the reconciliation result.

In the production dashboard, all headline metrics must come directly from the same calculated results table to avoid any discrepancy between KPIs, charts and detailed workings.

The impact screen should also explain changes by portfolio, stage, scenario, macroeconomic driver, model version and manual adjustment. Users should be able to drill down to individual facilities.

4. Database design — the tables I would create

For a Laravel and MySQL-based IFRS 9 platform, I would organize the database into five groups. These are logical tables rather than an exhaustive physical schema.

A. Macroeconomic data tables

Table	Important columns	Purpose
`macro_variables`	id, code, name, unit, frequency, country, active	Master list of economic variables
`macro_observations`	variable_id, period, value, value_type, source_id, release_date, vintage_id	Historical actuals, estimates and forecasts
`macro_sources`	id, institution, publication, reference_url	Stores the origin of economic information
`macro_import_batches`	id, filename, checksum, imported_by, status, errors	Tracks imports and data-quality checks
`macro_vintages`	id, as_of_date, published_at, source_version	Preserves historical forecast releases

The observations table might contain:

Variable	Period	Value	Type	Forecast vintage
GDP	2025	2.5%	Actual	2026-10
GDP	2026	3.2%	Forecast	2026-10
GDP	2027	4.1%	Forecast	2026-10
Inflation	2026	20.0%	Forecast	2026-10

All figures here are examples.

The critical design rule is that one variable can have multiple observations for the same period from different published vintages, but an ECL run must reference exactly which value and vintage it used.

B. Scenario tables

Table	Important columns	Purpose
`fli_scenario_sets`	id, reporting_date, vintage_id, version, status	A complete set of scenarios for a reporting date
`fli_scenarios`	id, scenario_set_id, name, probability, narrative	Base, upside, downside or other scenarios
`fli_scenario_values`	scenario_id, variable_id, forecast_period, value	Monthly/annual economic forecasts
`fli_scenario_weights`	scenario_id, segment_id, weight, valid_from	Optional segment-specific weights where justified
`fli_scenario_reviews`	set_id, reviewer, decision, rationale, reviewed_at	Governance and scenario review

I would treat the scenario set as the versioned container of all assumptions used in a particular month-end.

Once published, a scenario set should be immutable. Revisions create a new version rather than modifying an old approved record.

C. FLI model tables

Table	Important columns	Purpose
`fli_models`	id, target_metric, segment_id, methodology	Defines PD, LGD or EAD transmission model
`fli_model_versions`	id, model_id, version, calibration_date, status	Version-controlled specifications
`fli_model_coefficients`	model_version_id, variable_id, lag, coefficient	Estimated macroeconomic sensitivities
`fli_model_diagnostics`	model_version_id, metric, value, result	Validation and backtesting results
`fli_model_assignments`	segment_id, target_metric, model_version_id	Maps model to portfolio
`fli_overlays`	id, scenario_set_id, segment_id, rationale, amount_or_factor, status	Separately approved expert overlays

Additional tables should preserve calibration samples, data transformations, forecast methodologies, coefficient uncertainty and independent validation results.

D. Scenario-specific credit risk calculations

Table	Important columns	Purpose
`fli_projection_runs`	id, scenario_set_id, run_date, status	A complete FLI projection run
`fli_pd_term_structures`	run_id, segment_id, scenario_id, period, marginal_pd, survival_probability	Future probabilities of default
`fli_lgd_projections`	run_id, scenario_id, segment_id, period, lgd	Scenario-adjusted recovery severity
`fli_ead_projections`	run_id, scenario_id, facility_id, period, ead	Projected outstanding exposure

`fli_sicr_assessments`	run_id, facility_id, origination_risk, current_lifetime_risk, stage, reason	Forward-looking staging assessment
`fli_ecl_results`	ecl_run_id, facility_id, scenario_id, stage, ecl_amount	Scenario-level ECL
`fli_weighted_ecl`	ecl_run_id, facility_id, weighted_ecl	Final probability-weighted ECL

For very large loan books, do not store all facility-level term structures in one unpartitioned table. Use reporting-date partitioning, appropriate compound indexes and separate aggregate results from detailed calculation evidence.

E. EIR and cash-flow integration tables

These are especially relevant because your platform already handles effective interest calculations and discounted repayment profiles.

Table	Important columns	Purpose
`eir_calculations`	facility_id, original_eir, rate_basis, calculation_version, status	Initial EIR calculation and lineage
`eir_rate_history`	facility_id, effective_date, applicable_eir, reason	Relevant variable-rate or modification-related rate history
`contractual_cashflows`	facility_id, due_date, principal, interest, eligible_fees	Contractual payment schedule
`expected_cashflow_scenarios`	facility_id, scenario_id, payment_date, expected_receipt, recovery_type	Scenario-specific expected receipts
`discounted_cashflows`	ecl_run_id, facility_id, scenario_id, date, discount_rate, discount_factor, present_value	Discounted cash-flow evidence
`ecl_run_snapshots`	ecl_run_id, loanbook_id, fli_set_id, pd_version, lgd_version, eir_version	Complete reproducibility record

For performance, detailed scenario cash flows can also be stored in partitioned calculation-result tables, provided the bank retains auditable calculations.

A useful database design principle is that every ECL result has a traceable path to the source loan, approved scenario set, model versions, projected cash flows and EIR used.

5. End-to-end workflow for monthly IFRS 9 reporting

I would create a single guided workflow, rather than requiring bank users to visit seven unrelated pages and remember which tasks must be completed.

1. Create month-end reporting period

Select October 2026, establish cutoff date and lock the reporting context.

2. Load and validate source data

Import the loan book, repayment transactions, contractual cash flows, write-offs, recoveries and available macroeconomic updates.

3. Review economic assumptions

Check actual economic data, forecast revisions, scenario weights, relevant stress events and existing model suitability.

4. Run FLI projections

Calculate scenario-sensitive PD, LGD, EAD and lifetime credit risk. Run quality controls and model coverage checks.

5. Calculate staging, EIR and ECL

Assess SICR, apply the appropriate stage, calculate credit shortfalls and discount them using the applicable EIR.

6. Review results and reconcile

Compare ECL movements against the prior month, including portfolio, stage, balance, model, scenario and overlay impacts.

7. Approve and close

Risk and Finance approve the results, the reporting snapshot is frozen, and audit workbooks and reports become available.

The user should see the readiness of each step, with a clear explanation of any failure.

For example, if October's loan book is available but the model has no approved October-applicable FLI assumptions, the system should not silently default to historical PDs and produce a final official result.

It should show an explicit exception requiring approval of suitable assumptions.

6. Annual FLI review: what happens differently?

The annual FLI process should have a dedicated Model Review & Recalibration workflow, separate from the monthly scenario review.

During the annual cycle, the bank should be able to upload new years of historical default data, evaluate additional macroeconomic variables, rebuild modelling datasets, recalibrate candidate models and compare them against the current approved models.

The annual workbench should include out-of-time validation, observed-versus-predicted default rates, scenario sensitivity, parameter stability, portfolio segmentation and model limitations.

A new model should follow a controlled lifecycle:

```
Draft → Calibration → Validation → Risk Review → Approval → Published
```

The bank should be able to compare the revised model with the previous version using the same loan-book snapshot before publishing it.

Annual recalibration is not a reason to rewrite old figures. The December 2025 approved reporting results must remain reproducible even after a new model is introduced for 2026.

7. How FLI should interact with PD, LGD, EAD, EIR and repayments

This is the area where I would be particularly careful with the MAIIC implementation.

A. FLI and probability of default

Suppose a retail portfolio has a historically calibrated 12-month PD of 5%.

Once macroeconomic forecasts are applied, its conditional probabilities might change:

Scenario	Conditional 12-month PD
Upside	3.5%
Base	5.0%
Downside	8.0%

Using illustrative weights of 20%, 50% and 30%, the weighted PD would be:

\\[PD_{\mathrm{weighted}} =0.20(3.5\\%)+0.50(5\\%)+0.30(8\\%) =\boxed{5.6\\%} \\]

However, this is a simplified one-period calculation.

For actual Stage 2 lifetime ECL, I would not multiply the initial 12-month PD by the remaining number of years or blindly apply one uplift to a lifetime PD.

The engine should generate a scenario-specific marginal PD term structure, including survival probability and defaults in each future period.

B. FLI and LGD

For secured facilities, economic forecasts can influence expected recovery values, recovery costs and the timing of collateral realization.

The LGD model might generate:

Scenario	Illustrative LGD
Upside	30%
Base	35%
Downside	45%

If the existing LGD calculation already embeds adverse collateral assumptions, applying another downside adjustment to the same risk can double-count losses.

The bank should clearly identify which risk drivers are already included in historical LGD and which are introduced through FLI.

C. FLI and EAD

EAD generally follows expected outstanding exposures, scheduled amortization and, where relevant, future drawings and credit conversion factors.

For a fully drawn amortizing term loan, the expected balance may decline each month according to the repayment profile.

For an overdraft or revolving exposure, stressed economic conditions might affect drawings, utilization and future exposures.

The FLI engine therefore needs to connect to the facility-level repayment schedule rather than assume that every loan maintains its current outstanding balance until maturity.

D. FLI and EIR

Here is the distinction I would preserve in the architecture.

Item	What it represents	How FLI affects it
EIR	Effective financing yield determined under IFRS 9	FLI does not ordinarily change original fixed-rate EIR
Contractual cash flows	Payments due under the loan contract	Not directly rewritten merely because the economic outlook changes
Expected cash flows	Amounts and timing expected to be received	Can change under different economic scenarios
Discount factor	Converts future cash flows to reporting-date value	Uses the appropriate IFRS 9 discount rate
ECL	Present value of expected credit shortfalls	Changes with scenario-specific default and recovery expectations

Under IFRS 9, ECL is generally discounted using the EIR determined at initial recognition or an appropriate approximation. Floating-rate instruments and purchased or originated credit-impaired assets have particular rules that must be handled separately.

[image](https://www.google.com/s2/favicons?domain=https://www.ifrs.org\&sz=32)

IFRS

+1

Do not apply the current Malawi policy rate as the ECL discount rate simply because it is part of the FLI forecast.

The policy rate may explain how credit risk evolves. It does not replace the facility's IFRS 9 EIR.

E. How FLI and discounted repayments should work together

Consider a simplified example.

A loan has a 12% annual effective interest rate, a contractual payment of MWK 110,000 in one year, and the following possible expected payments:

Scenario	Expected receipt	Cash shortfall
Upside	MWK 108,000	MWK 2,000
Base	MWK 100,000	MWK 10,000
Downside	MWK 80,000	MWK 30,000

For this simple annual example:

\\[PV(\text{shortfall}_s) =\frac{\text{Contractual CF}-\text{Expected CF}_s}{1+EIR} \\]

The discounted ECL per scenario becomes approximately:

Scenario	Discounted ECL
Upside	MWK 1,786
Base	MWK 8,929
Downside	MWK 26,786

With the same 20%, 50% and 30% weights:

\\[ECL_{\mathrm{weighted}} =0.20(1,786)+0.50(8,929)+0.30(26,786) \\]

\\[\boxed{ECL\approx MWK\ 12,857} \\]

This illustrates the correct relationship: the economic scenarios influence the expected receipts, while the applicable EIR discounts the resulting shortfalls.

For real loan portfolios, calculations require individual payment dates, actual day counts, expected recovery dates, default timing, staging and the bank's approved cash-flow methodology.

F. Stage 1, Stage 2 and Stage 3 treatment

I would implement the stage-specific treatment as follows:

Stage	FLI application	Calculation basis
Stage 1	Forward-looking 12-month default risk	Lifetime cash shortfalls arising from defaults possible in the next 12 months
Stage 2	Forward-looking lifetime default risk	Cash shortfalls arising from defaults possible over expected life
Stage 3	Forward-looking cash recovery assumptions	Probability-weighted discounted expected credit shortfalls for credit-impaired exposures

For Stage 1, remember that a 12-month ECL is not necessarily the cash shortfall occurring within the next 12 months. It includes lifetime shortfalls associated with defaults that could occur during that 12-month default window.

For Stage 2, a simplified discrete-time approach is:

\\[ECL_s = \sum_{t=1}^{T} mPD_{s,t}\times LGD_{s,t}\times EAD_{s,t}\times DF_t \\]

Where \\(mPD\\) is the marginal probability of default for period \\(t\\), accounting for survival to that period.

The final provision is:

\\[ECL_{\mathrm{final}}=\sum_{s=1}^{S}w_sECL_s \\]

This PD/LGD/EAD expression is an approximation requiring consistency with the contractual cash-shortfall definition and recovery timing.

For Stage 3, especially where MAIIC already calculates discounted repayments and recoveries, I would make the cash-flow shortfall approach the primary valuation method whenever reliable facility-level projections exist:

\\[ECL_s = PV(\text{Contractual CF}) - PV(\text{Expected CF}_s) \\]

The precise implementation must reconcile to the asset's gross carrying amount under IFRS 9. It should not automatically multiply an already credit-impaired facility's discounted shortfall by a separate PD that would recognize the same default risk again.

Also, if a Stage 3 expected cash-flow model already reflects recoveries from security, the system must not deduct the same collateral benefit a second time.

This is why I would build one shared cash-flow and discounting service used by all stages, with the appropriate stage-specific ECL methodology.

8. Controls and reconciliation I would make compulsory

An IFRS 9 FLI module should have proper audit controls from the beginning, not added after an audit identifies issues.

These are the most important automated checks:

Control	Expected action
Scenario probabilities do not total 100%	Block scenario publication
Forecast is missing for a required period	Flag missing information and block an unsupported official run
Unapproved model version selected	Block official ECL
Loan has no valid EIR or applicable discount rate	Flag for controlled resolution, not silent zero
Facility has no portfolio model assignment	Report unmapped exposure
Scenario PD outside valid probability bounds	Block invalid results
Inconsistent monthly/annual macro units	Block until corrected
Scenario already includes a risk also applied as overlay	Require double-counting review
ECL differs significantly from prior period	Require investigation and commentary
Approved forecast subsequently revised	Retain old version and create a new one

The bank should also have an ECL movement reconciliation showing opening ECL, balance movements, new facilities, derecognition, stage transfers, changes in credit risk, FLI movements, recoveries and other relevant adjustments.

For the illustrative FLI dashboard above, the reconciled scenario-weighted ECL is MWK 11.90 billion, representing a 19.0% increase over MWK 10.00 billion before FLI. Those are the values the headline KPIs should display.

9. Reports and Excel audit workbooks

I would make the following exports available from the FLI module:

- Macroeconomic Data Workbook: historical actuals, forecasts, source references and revisions.
- Scenario Workbook: upside, baseline and downside paths, weights and rationale.
- Model Calibration Workbook: datasets, coefficients, model diagnostics and validation results.
- PD/LGD/EAD FLI Workbook: scenario-specific projected risk parameters and term structures.
- EIR & Discounted Cash-Flow Workbook: contractual payments, expected receipts, discount factors and present values.
- FLI Impact & ECL Reconciliation Workbook: weighted ECL, movements, stage changes and driver attribution.
- Approval & Audit Workbook: users, timestamps, model versions, scenario versions and signed-off decisions.

Each export should include a report-date identifier and run ID so that someone reviewing the 31 October 2026 report can reproduce its workings without using revised November assumptions.

10. How I would implement this in your Laravel IFRS 9 system

I would separate the calculation engine into services with explicit inputs and outputs.

Service	Responsibility
`MacroDataService`	Validates macroeconomic observations and vintages
`ScenarioSetService`	Manages forecasts, scenario weights and approvals
`FliCalibrationService`	Calibrates and validates credit risk relationships
`FliProjectionService`	Generates scenario-specific PD, LGD and EAD
`SicrAssessmentService`	Determines forward-looking credit deterioration and staging
`EirCalculationService`	Determines and maintains applicable EIR
`CashflowProjectionService`	Constructs contractual and scenario-dependent expected cash flows
`DiscountingService`	Calculates present values using IFRS 9 discount conventions
`EclCalculationService`	Calculates scenario ECL and probability-weighted provision
`EclReconciliationService`	Attributes changes in ECL and produces audit evidence

The complete process should look like this:

Loan Book + Repayment Schedules + Macro Data

EIR Engine

Rates, amortized cost, discount conventions

FLI Engine

Forecasts, scenarios, PD, LGD, EAD

Staging + Expected Cash-Flow Engine

Time-dependent defaults, scheduled receipts and recoveries

Scenario-Specific Discounted ECL

Weighted Final ECL + Audit Evidence

Month-end results, reconciliation, approval and reporting

11. What I would prioritize for MAIIC

Given that the system already has an EIR engine and discounted repayment calculations, I would not rebuild those parts merely to add FLI.

I would implement the following in order:

1. Build the macroeconomic data and scenario management module, including source data, historical forecast vintages, probability weights and approvals.
2. Build the model calibration and projection engine, initially focusing on PD and adding scenario-sensitive LGD/EAD where material and supportable.
3. Integrate the projections into staging and the existing cash-flow engine, ensuring EIR discounting is preserved and credit losses are not counted twice.
4. Introduce a monthly FLI review and close workflow, so users can update forecasts, compare ECL impacts and authorize a reporting run.
5. Add independent validation, backtesting, reconciliation and audit exports, including full traceability from macroeconomic forecasts to facility-level ECL.

The key design decision is that the FLI module should not merely produce an adjusted PD percentage. It should produce a versioned, approved, scenario-specific credit risk projection that the ECL engine can consume for the appropriate reporting date.

That will allow MAIIC to perform monthly ECL calculations while maintaining a controlled annual modelling process, and it will make the connection between forward-looking assumptions, EIR, discounted repayments and final provisions transparent to auditors.

The methodology should ultimately be aligned to MAIIC's approved accounting policy, validated using its loan and default history, and reviewed against IFRS 9 and applicable Malawi regulatory requirements. The EBA's guidance is also a useful reference for model governance, validation and the treatment of forward-looking economic information, although it is not itself Malawi regulation.

CLAUDE (2026-10-13 08:25:40 UTC)

My view of the proposal: **it's sound, and about half of it already exists in MAIIC**, sometimes under different table names. Before writing the spec I'll check what the system has against each part of the proposal, so the spec builds on what exists rather than adding a second forward-looking module on top of the first. A duplicate module is exactly how the legacy tools came about.

 * Resolves the rate at which expected credit losses are discounted.
 *
 * IFRS 9 §5.5.17(b) requires ECL to be discounted at the effective interest
 * rate determined at initial recognition, not at a funding or risk-free rate.
 * A facility yielding 30% and one yielding 10% do not carry the same present
 * value of a loss two years out, and using one rate for both moves the
 * allowance in a direction nobody can explain.
 *
 * Every resolved rate carries the basis it came from, following the same
 * convention as `rate_source`, `schedule_source` and `cash_source`: a mixed
 * run has to be explainable line by line, and an approximation has to be
 * visible as one.
 *
 * There is deliberately no default rate. The previous behaviour fell back to
 * a hardcoded 10% whenever a rate could not be found, which silently produced
 * an allowance for a facility whose discounting basis was unknown. A payment
 * whose rate cannot be resolved is now returned as unresolved and excluded by
 * the caller, named.
 */
### 14.7 How the adjustment reaches the PD: the transmission method

The route of 14.6 says where the adjustment comes from. The transmission method says how it moves a loan's PD once it exists. MAIIC has one method today, the multiplicative scalar; it is kept as the default, and the alternatives are built as governed choices with the data each one needs, so that the

**What the scalar does, and what it implies.** The adjustment is a ratio to the base period (predicted proxy in the window over predicted proxy today, less one), and the loan's PD is multiplied by one plus that ratio. It is proportional, the same for every loan whatever its starting PD, and linear i

**The governed setting**, `fli_transmission_method`, with the preconditions the guardrail checks before a method may run. A method whose preconditions are not met is declined with the reason and the PD holds, exactly as a failed fit is declined.

| Method | Transmission | Needs | Status |
|---|---|---|---|
| **Multiplicative scalar on the proxy ratio** (seeded) | post-FLI PD = pre-FLI PD × (1 + adjustment); the adjustment is predicted proxy(window) / predicted proxy(base) − 1 | An approved fit, or an overlay | MAIIC's method; kept |
| Segment-specific scalar | The same, with one fit and one adjustment per portfolio or product group, from the segment proxies the deriver produces | A derivable proxy per segment (two or more periods each) | The natural next step; the deriver of 14.4 makes it possible |
| The nine reference methods | The suite's governed producers of a factor from a fit crossed with the scenario-weighted driver: the weighted statistic; the annual difference and the annual change in the driver; both scaled by the correlation; the absolute PD forecast from the equation; the forecast- | | |
| Logit-linear PD model | logit(PD) = α + β × macro; the move is in log-odds, so proportional in the odds rather than the probability and bounded by construction | A grade-level or loan-level default series long enough to fit (the guardrail's minimum observations, at the grade level) | Available |
| Vasicek single-factor Z-shift | The through-the-cycle PD is moved through the latent systematic factor: PIT PD = Φ[(Φ⁻¹(TTC PD) − √ρ × Z) / √(1 − ρ)], with Z from the macro fit and ρ governed; the shift is largest for mid-range PDs and bounded by construction | A governed asset co | |

Whichever method is in force, three things do not change: Stage 3 is 100 percent; Stage 1 takes the 12-month window and Stage 2 the lifetime window; and the result is floored at 0 and capped at 100 percent. The method runs once per scenario under the weighting of 15.5, and the loan row records the m

**The system explains each method, in the screen, not only in this document.** On the FLI Adjustments screen and beside the setting in the Governance Centre, every method has a **method card** with the same five parts: what it does, in two or three plain sentences a finance officer can read; the for

**Switching.** A change of method is a governed change with an effective date, under maker-checker, like every other setting. The first period run under a new method shows the ECL under both methods and the difference, which is itself a disclosure the auditors will want, as it is for the scenario we

### 14.8 Lineage on the loan

Five columns are added to the loan-book row beside the adjustment and the post-FLI PD: the route used, the transmission method, the parameter record, the model version and the scenario set. The ECL report and the impairment audit workbook can then say, for every loan, which model, which overlay, whi

### 14.9 Where it lives, and the settings

Financial Modelling › Forward-Looking Model: **Correlation Finder** (new), **Regression Analysis** (repaired), **FLI Adjustments** (new: the route, the regression result, the overlay register, the apply-to-loans step with its counts), **Weighted Forecast** (now computed from the scenario set). The
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App

## CLAUDE (2026-10-13 08:26:25 UTC)

I have what I need. Here's how the proposal compares with what MAIIC already has, before I write it up:

| The proposal asks for | MAIIC today |
|---|---|
| Macro data with sources, imports, as-at reading | **Exists:** Macro Statistics, import batches. The as-at fix reads data as known at each month-end. *Gap:* true publication dates (vintages); today the load date stands in. |
| Versioned, immutable, maker-checker scenario sets | **Exists:** spec v4 section 15. Scenario Sets proposed, approved, locked and versioned, with weight rules and sensitivity. |
| Model calibration with diagnostics | **Partly:** Correlation Finder and Regression, with the guardrail and approval. *Gaps:* no model registry or versions; the fit is re-estimated **every month** instead of once a year. |
| Separate overlays | **Exists:** Manual Overlays register. *Gap:* no double-counting check. |
| ECL per scenario, then weighted | **Partly:** the stage PD is weighted to reproduce the weighted ECL, which is exact only |
```

```
while forward-looking adjustments move PD alone. |
| Stage 2 lifetime PD term structure per scenario | **Gap:** one 12-month adjustment carried into a lifetime formula. The
tables exist but are empty. |
| LGD and EAD forward-looking adjustment | **Gap:** forward-looking adjustments move PD only. |
| EIR discounting kept separate | **Exists:** a discounting service with no fallback rate. *To confirm:* the current-rate rule
for MAIIC's 36 PLR-linked floating loans. |
| Run snapshot and full lineage | **Partly:** lineage columns on loans and ECL rows. *Gap:* no single snapshot record per run. |
```

Where I'd differ from the proposal:

1. **Reuse the existing tables.** Its table list would create a second set alongside the existing one, which is how the legacy tools came about.
2. **A logit model on MAIIC's own defaults isn't supportable yet,** with only about 2 years of monthly data. A credit-cycle shift driven by an industry or RBM NPL series fits better until more history exists.
3. **Its 50/20/30 weights are illustrative.** MAIIC's approved set is 50/15/25/10, including a severe scenario.

I'll write it as its own specification, cross-referenced to spec v4 sections 13 to 15, so it doesn't clash with your colleague editing v4. First checking how the team's spec renderer works, so the Word and PDF versions match the house format.

people: Project sponsor Dr Thomson Kumwenda, CFO | Engagement lead Edward Mazibuko CA(SA) | Build lead Kundai Muriwo
status: Draft for review. Builds on specification version 4, sections 13 (macro statistics), 14 (forward-looking adjustments)
and 15 (economic scenarios), which stay in force; where this document decides something new, it says so and it governs for the
forward-looking module.
---

## 0. Why this document, and how to read it

A proposal for a complete forward-looking information (FLI) module was put to the team on 13 October 2026. It describes the
module a bank should have: macroeconomic data with its history of forecasts, governed scenarios, calibrated models,
scenario-level ECL, discounting at the effective interest rate, a monthly close and an annual review, controls and audit
workbooks.

The proposal is right in its principles. Most of what it asks for already exists in the MAIIC system, some of it under other
names, and some of it is missing. This document does three things: it maps the proposal onto what is built (section 2), it
records the decisions that close the gaps (section 3), and it sets the target design and the order of work (sections 4 to 9).
Section 10 lists what MAIIC and Dr Thom are asked to decide.

One rule runs through all of it: **the module extends what exists; it does not build a second forward-looking process beside
the first.** A parallel set of tables is how the legacy tools came about (now kept under Administration, Legacy FLI tools, and
not used by the ECL).

## 1. What IFRS 9 asks for

| Requirement | Where | What it means for MAIIC |
|---|---|---|
| An unbiased, probability-weighted amount, from a range of possible outcomes | 5.5.17(a), B5.5.42 | More than one scenario
where the loss responds non-linearly to the economy; the loss is weighted, not the economy |
| The time value of money | 5.5.17(b), B5.5.44 | Shortfalls discounted at the effective interest rate set at initial
recognition; for a floating-rate asset, the current effective rate |
| Reasonable and supportable information about past events, current conditions and forecasts, without undue cost | 5.5.17(c),
B5.5.49 to B5.5.54 | Only information available at the reporting date; forecasts may lean on long-run averages beyond the
reasonable forecast horizon |
| 12-month ECL in Stage 1, lifetime in Stage 2 and 3 | 5.5.3, 5.5.5 | The forward-looking view enters the PD over the right
window: one year for Stage 1, the remaining life for Stage 2 |
| Credit-impaired assets | Appendix A, B5.5.33 | Stage 3 is measured on the shortfall of expected cash flows; no further PD is
applied on top of the default that has happened |

IFRS 9 does not prescribe a model, a number of scenarios, or a formula for the adjustment. Each is a choice MAIIC makes,
supports with evidence, documents and keeps under review.

## 2. The proposal against what is built

| The proposal asks for | In the MAIIC system today | Status |
|---|---|---|
| Macroeconomic variables, observations, sources and import batches | Macro Statistics (`macro_statistics`,
`macro_statistics_data`, `macro_source_import_batches`), World Bank fetch with an offline snapshot, IMF WEO and RBM policy-rate
files, the bridge to monthly series (`macro_series`) | Built (spec v4 section 13) |
| Forecast vintages: a value as known on a date | Every FLI read goes through `AsAtSeries` (commit ac12c36): a period sees only
what was knowable by its end, with a governed publication lag per series | Built in the engine; **gap:** the vintage is the
load date, not the publisher's release date |
| Scenario sets, versioned, approved, immutable once published | `governed_scenario_sets`, `governed_scenarios`,
`scenario_shocks`; proposed by one person, approved by another, locked with the period; rules (at least 3 scenarios, base at
least 40 percent, no weight above 60 percent, a calibration note on every downside); back-test and sensitivity | Built (spec v4
section 15) |
| Model calibration with diagnostics | Correlation Finder (`fli_suggestions`, `analysis_runs`), Regression (`fli_relationships`,
 `fli_fits`) under the guardrail (sign, R-squared, p-value, minimum observations), maker-checker approval, method cards | Built;
 **gap:** no model registry: a fit is re-estimated and re-approved every month instead of once a year |
| Segment-specific models | PD and LGD by segment on a governed basis (portfolio, RBM sector, both), with a thin-segment rule
(commit 67087b1) | Built for PD and LGD; **gap:** the FLI fit is book-level only |
| Separately approved expert overlays | Manual Overlays register (`fli_overlays`): scope, reason, evidence, owner, expiry,
maker-checker, shown as its own line | Built; **gap:** no check that an overlay does not repeat a risk the model already
carries |
| Scenario-level ECL, then weighted | The route weights the stage PD so that the booked ECL equals the scenario-weighted ECL
(commit ac12c36) | Built while FLI moves the PD alone; **gap:** once LGD or EAD vary by scenario, the ECL must be computed per
scenario and then weighted |
| A marginal PD term structure per scenario for lifetime ECL | Tables exist and are empty (`ecl_projection_runs`,
`ecl_pd_term_structures`, `ecl_cashflow_projections`, `ecl_recovery_cashflows`); the Stage 2 lifetime PD is 1 - (1 -
PD12)^(months/12) with one 12-month adjustment | **Gap** |
| FLI on LGD and EAD | FLI moves the PD only | **Gap** (and a decision, section 3) |
| ECL discounted at the EIR, separate from FLI | `EclDiscountingService` and `EclDiscountRateService`: the locked original EIR,
no fallback rate, unresolved loans named | Built; **gap:** PLR-linked floating loans use the original EIR as a labelled proxy,
not the current effective rate |
| A guided monthly close | Workspace close checklist; Maintenance, Month-end (the steps in order); Installation Guide 9.9 |
Built; **gap:** no FLI readiness gate in the checklist |
| A run snapshot for reproducibility | Lineage on each loan (`fli_route`, `fli_method`, `fli_fit_id`, `fli_set_id`,
`pd_segment_run_id`) and on each ECL row | Partly; **gap:** no single snapshot record per ECL run |
| ECL movement reconciliation | The IFRS 9 note for the annual financial statements (allowance and gross carrying amount by
stage, the charge, the basis) | Built; **gap:** no line for the FLI movement on its own |
| Audit workbooks | The compliance workbooks, the auditor's pack, branded exports of every report | Partly; **gap:** the model
```

calibration and scenario workbooks |

3. Decisions

Each decision has a number so the build, the tests and the screens can refer to it.

D-F1. Three cadences, not one

Activity	Cadence	Who
The FLI model: drivers, lags, coefficients, method	Once a year, and when an event breaks the relationship (a devaluation, a drought, a change of policy regime)	Risk proposes; a second reviewer validates; the CFO approves
The scenario set: paths and weights	Every quarter, and when the outlook moves materially; confirmed (not rebuilt) at each month-end	Finance or ALCO proposes; a second person approves
Applying the approved model and scenarios to the loans	Every month-end	The month-end run

Today the regression is re-estimated and re-approved every month. That changes: the month-end **applies** the model version in force at the reporting date; it does not re-fit it. A month-end that finds no approved model or scenario set in force for its date stops with the reason; it never falls back to the pre-FLI PD for an official run.

D-F2. The model registry

The fits stay the calibration evidence. An approved fit is promoted into a **model version** with an effective date, its coefficients, its diagnostics and its segment assignment. The route reads the version in force at the reporting date. A recalibration creates a new version; old versions are never edited, so a December 2025 result stays reproducible after a 2026 model is published.

Lifecycle: Draft, Calibrated, Validated, Approved, Published, Retired. Moving to Approved needs a second person; moving to Published sets the effective date.

D-F3. Weight the loss, scenario by scenario

The ECL is computed once per scenario and then weighted: ECL = sum over scenarios of weight x ECL(scenario). Today the weighted stage PD reproduces this exactly because only the PD moves. As soon as the LGD, the EAD or the cash flows vary by scenario, the per-scenario computation is the only correct one. The per-scenario results are stored, so the sensitivity table and the booked allowance come from the same rows.

D-F4. A lifetime term structure per scenario

For Stage 2 the engine builds, per scenario, a marginal PD for each future year of the remaining life, with the survival probability to that year, from the scenario path and the approved model; the path reverts to the long-run average beyond the reasonable forecast horizon (B5.5.50), with the horizon a governed setting (three years proposed). Lifetime ECL = sum over years of marginal PD x LGD x EAD x discount factor. Stage 1 uses the first year only. The tables built for this (`ecl_pd_term_structures`, `ecl_projection_runs`) are used rather than new ones.

D-F5. Stage 3

Stage 3 is not given a PD. Its loss is the shortfall of expected recoveries, discounted at the EIR, where recoveries are modelled loan by loan; otherwise EAD x LGD at the reporting date. Scenarios may move the size and the timing of recoveries (the LGD and the time to realise collateral), never the fact of default. A collateral benefit counted in the LGD is not deducted again.

D-F6. The discount rate

FLI never changes the effective interest rate or the contractual cash flows. A fixed-rate loan is discounted at its locked original EIR. A floating-rate loan linked to the prime lending rate is discounted at its **current** effective rate (B5.5.44): the original spread over the PLR in force at the reporting date, taken from the reference-rate series as at that date. Until that is built the original EIR stays as the labelled proxy it is today. The Malawi policy rate is a driver of credit risk in the scenarios; it is never the discount rate.

D-F7. The transmission method while MAIIC's history is short

MAIIC has about two years of monthly loan-level history from E-Banker (July 2024 onwards). A logit model on MAIIC's own defaults is not yet supportable. The proposed order:

Method	Use	Status
Credit-cycle (Vasicek single-factor) shift: the PD moves through a systematic factor Z estimated from an industry series, with the asset correlation governed	Default, once an industry series is held	Method card exists; needs the RBM or industry NPL series
Multiplicative scalar on a fitted proxy ratio (today's method)	Until the industry series is held, and as the challenger afterwards	In force
Logit model on grade-level default rates	When at least five years of grade-level history exist	Method card exists; preconditions not met

Whichever method is in force, the guardrail adds a **stationarity check** (levels that trend together are fitted on their changes, or refused), because two series rising over two years will always look related.

D-F8. FLI on LGD and EAD

Phase 1 moves the PD only. The LGD may be made scenario-sensitive where there is evidence: for agricultural lending, the price of the financed crop and the realisable value of warehouse-receipt collateral. The EAD follows the contractual repayment schedule and, for undrawn commitments, the governed utilisation; it is not stressed in phase 1. Each extension is a governed decision with its own method card.

D-F9. Overlays and double counting

An overlay names the risk it covers (a driver, a sector, an event). The system refuses to approve an overlay whose stated risk is already a driver of the model version in force for the same segment, unless the reviewer records why the model does not capture it. An overlay has an expiry date; an expired overlay drops out of the next run.

D-F10. Vintages from the publisher

Each macro observation keeps the date its publisher released it, not only the date it was loaded. A forecast revised in October never replaces the one that was available at a March close; both are kept, and the ECL run records which vintage it read. Where a release date is unknown, the governed publication lag of the series applies and the value is labelled as an estimate of availability.

D-F11. A snapshot per ECL run

Each official ECL run records, in one row: the loan book build, the staging run, the segment PD/LGD run, the FLI model version, the scenario set and version, the overlays applied, the EIR lock, the discounting basis and the macro vintage. A reviewer of 31 October 2026 can then rebuild that month's figure with nothing revised later.

D-F12. The month-end gate

The Workspace close checklist gains an FLI step that is done only when an approved model version and an approved scenario set are in force for the period and have been applied to every loan. The ECL run already refuses a loan without a stage, PD or LGD (commit 70b7333); it also refuses an official run without the FLI step done.

4. The screens

The forward-looking module moves out of IFRS 9 Model Setup into its own menu entry, **Forward-Looking Information**, with one tab row (the section-tab pattern used across the system):

Tab	What it holds	Built from
Overview	The period's FLI readiness: model version in force, scenario set in force, vintage, overlays, the effect on the ECL, what is missing	New
Economic Indicators	The series, actuals and forecasts kept apart, source and release date per value, revisions compared, imports with how-to and samples	Macro Statistics
Scenario Workbench	Draft, compare and approve scenario sets: paths per series per year, weights, narrative, calibration note, trajectories charted against history	Scenario Sets
Model Calibration	The annual workbench: data selection, the Correlation Finder, the fits under the guardrail, out-of-time back-test, stability, the model version and its lifecycle	Correlation Finder and Regression
Overlays	The overlay register with the double-counting check	Manual Overlays
Impact Analysis	Proposed against approved: ECL per scenario, weighted ECL, by portfolio, stage, driver and overlay; drill to the loan	New, from the per-scenario results
Approval and History	Every model version, scenario set and overlay, who proposed, who approved, when, and what each month-end ran under	New, from the existing approval records

Every figure on the Overview and Impact Analysis tabs comes from the same stored results as the ECL and the dashboard build-up panel, so a headline can never disagree with the detail.

5. The data model

The rule is reuse. New tables are added only where nothing exists.

Purpose	Table	Change
Variables	`macro_statistics`	Keep
Observations and vintages	`macro_statistics_data`, `macro_series`	Add `published_at` (publisher's release date), `vintage` and `value_type` (actual, estimate, forecast) where missing
Sources and imports	`macro_source_import_batches`	Keep
Scenario sets, scenarios, paths	`governed_scenario_sets`, `governed_scenarios`, `scenario_shocks`	Keep; add the narrative and the trajectory per year where not held
Calibration evidence	`analysis_runs`, `fli_suggestions`, `fli_relationships`, `fli_fits`	Keep (duplicates are no longer written, commit b6e6baf)
Model registry	`fli_models`, `fli_model_versions`	**New:** model (target metric, segment, method), version (coefficients, lags, diagnostics, lifecycle status, effective date, approvals), linked to the fit it came from
Segment assignment	`fli_model_assignments`	**New:** segment to model version, effective date
Overlays	`fli_overlays`	Add the risk covered and the double-counting review
Term structures and cash flows	`ecl_projection_runs`, `ecl_pd_term_structures`, `ecl_cashflow_projections`, `ecl_recovery_cashflows`	Use (they exist, empty)
Per-scenario ECL	`ecl_scenario_results`	**New:** loan, run, scenario, stage, ECL undiscounted and discounted
Weighted ECL	`loan_books`, `expected_credit_loss`	Keep
Run snapshot	`ecl_run_snapshots`	**New** (D-F11)

For a large book the per-scenario and term-structure tables are partitioned by reporting period, with the aggregates kept apart from the loan-level evidence.

6. The engine

The existing services are extended, not replaced:

Service	Role in the module
`MacroImportService`, `AsAtSeries`	Observations and vintages as known at the reporting date (D-F10)
`ScenarioSetService`	Scenario sets, weights, approval, sensitivity (unchanged role)
`CorrelationFinder`, `RegressionEngine`, `Guardrail`	Calibration evidence, with the stationarity check (D-F7)
`FliModelRegistry` (new)	Promotes an approved fit to a model version; resolves the version in force for a segment and date (D-F2)
`FliProjectionService` (new)	Per scenario: the PD term structure, and the LGD where in scope (D-F4, D-F8)
`FliRouteService`	Writes the post-FLI parameters and the lineage to each loan
`EclDiscountRateService`, `EclDiscountingService`	The EIR basis, including the floating-rate current EIR (D-F6)
`TimePhasedEclService`	The per-scenario, per-year ECL, then the weighting (D-F3)
`EclBuildUpService`, the IFRS 9 note	The build-up and the movement reconciliation with an FLI line

7. Controls

Control	Action
Scenario weights do not total 100 percent, or break the governed rules	Publication refused
A forecast is missing for a period the horizon needs	Flagged; an official run is refused

No approved model version or scenario set in force for the reporting date	An official run is refused (D-F12)
A loan without a stage, PD, LGD or resolvable discount rate	Named and excluded from nothing silently; the run refuses (built)
A segment without a model assignment	Reported as unmapped exposure
A scenario PD outside 0 to 100 percent	Capped, and the cap reported; a model producing it is flagged for review
Monthly and annual units mixed in one series	Import refused
An overlay repeating a modelled driver	Approval refused without a recorded reason (D-F9)
ECL moves by more than a governed tolerance from the prior month	Commentary required before sign-off
A forecast revised after it was used	The old vintage kept; the revision becomes a new vintage

8. Reports and workbooks

The Report Hub gains, under Annual report and audit and under Risk and analytics:

- The FLI scenario workbook: the paths, weights, narrative and approvals of the set in force.
- The model calibration workbook: the data, the coefficients, the diagnostics, the back-test and the validation sign-off of the model version in force.
- The FLI impact workbook: ECL per scenario and weighted, by portfolio and stage, with the driver attribution and the overlays.
- The FLI line in the IFRS 9 note's movement reconciliation.

Each carries the reporting date and the run identifier, so it can be reproduced from the run snapshot.

9. Order of work

Phase	Content	Acceptance
1. Cadence and registry	D-F1, D-F2, D-F12: the model version in force is applied monthly; no monthly re-fit; the month-end gate	A month-end with no model version in force refuses; re-running August with the same version reproduces the booked ECL to the kwacha
2. Per-scenario ECL and term structure	D-F3, D-F4, D-F5: per-scenario results stored, Stage 2 lifetime by year with survival, Stage 3 on the shortfall basis	Weighted per-scenario ECL equals the booked ECL; the sensitivity table reads the same rows; a Stage 2 loan's lifetime ECL is shown year by year
3. Discounting and vintages	D-F6, D-F10, D-F11: floating-rate current EIR, publisher release dates, the run snapshot	A PLR-linked loan's discount rate moves with the PLR as at the date; a March run re-read in October gives the March figure
4. Screens	Section 4: the Forward-Looking Information menu, Overview, Impact Analysis, Approval and History	Every headline figure equals the stored results; one tab row; the Legacy FLI tools stay under Administration
5. Method and LGD	D-F7, D-F8, D-F9: the credit-cycle method on an industry series, the stationarity check, scenario-sensitive LGD where evidenced, the overlay double-counting check	The method card's preconditions pass on MAIIC's data; an overlay on a modelled driver is refused without a reason
6. Workbooks	Section 8	Each workbook reproduces from the run snapshot

Each phase lands with its tests, its screens, the user and administrator manuals updated, and the Installation Guide month-end run (section 9.9) amended where a step changes.

10. Asked of MAIIC and Dr Thom

#	Question	Why it matters
1	Do you agree the three cadences of D-F1 (model yearly, scenarios quarterly, application monthly), and who owns each?	Today the fit is re-approved every month, which is neither necessary nor what auditors expect
2	Can the Reserve Bank's industry NPL series (or the DFI peer series) be obtained, monthly or quarterly, as far back as possible?	It is the series the credit-cycle method needs while MAIIC's own history is short
3	Who proposes and who approves the scenario set: Finance, Risk, ALCO? Are the current weights (50 / 15 / 25 / 10, with a severe scenario) the starting point?	Governance of the weights is the first question an auditor asks
4	Should the LGD of agricultural loans respond to the scenarios through crop prices and warehouse-receipt values?	Decides whether phase 5 includes a scenario-sensitive LGD
5	For PLR-linked floating loans, is the current effective rate (original spread over the PLR in force) the accepted discount basis?	D-F6; it changes the discounted ECL of 36 floating contracts
6	What month-on-month ECL movement should require commentary before sign-off?	Sets the tolerance in section 7
7	Is a three-year reasonable forecast horizon, with reversion to the long-run average after it, acceptable?	Sets the horizon of D-F4

11. Where the current figures stand

For August 2026 on the demonstration database: ECL before FLI MWK 11.76 billion, forward-looking effect MWK (0.44) billion, manual overlays nil, ECL booked MWK 11.31 billion. The approved fit is the prime lending rate to the Stage 3 share at a nine-month lag (R-squared 0.74 on 26 monthly points), under the first scenario set. Every approval on that database is labelled "Demo, not a MAIIC approval". The fall in the ECL from the forward-looking effect follows the PLR's decline from 25.3 to 20.8 percent; with 26 points and one driver, it is model output to be challenged, not yet a conclusion, which is the case for phases 1 and 5.

Result of Write

File created successfully at: c:\xampp\htdocs\MAICC-IFRS9\docs\MAIIC_FLI_Module_Specification_v1_2026-10-13.md (file state is current in your context — no need to Read it back)

Context summary written when the conversation was compacted (2026-10-13 08:30:40 UTC)

This session is being continued from a previous conversation that ran out of context. The summary below covers the earlier portion of the conversation.

Summary:
1. Primary Request and Intent:
   - Original: pull all MAIIC changes, load the DB, run needed commands (done).
   - Then a long UI/engine overhaul of the MAIIC IFRS 9 system (`C:\xampp\htdocs\MAICC-IFRS9`), driven by user feedback: restore the old MAIIC layout with buttons top-right, a TNM Mpamba-style dashboard and sidebar in MAIIC colours, 15 rows per page with page numbers, full-width pages, related screens consolidated as tabs (tabs styled like the EIR Data in-page tabs, below the header, with real counts, one tab row per page), compact one-line KPI cards, little above tables, no browser pop-ups, imports with instructions/sample CSV/history, Reports as one hub (consolidated 39→17 reports plus the IFRS 9 annual-report note), Settings cleaned of Eswatini/credit-scoring items, the ECL run for Jan–Aug 2026 on demo, the FLI chain run and as-at bug fixed, PD by portfolio/sector/RBM class, SICR qualitative factors seeded, a Loan Book/ECL table lineage redesign, push changes as you go, and a runbook of client commands.
   - Recent requests: dashboard order "charts second after the card visuals" (done); Download PDF button "nice and smaller" (done); a Maintenance page to run bootstrap/commands from the UI like the Stress Testing app (done); explain legacy vs current FLI (answered).
   - **Most recent request (in progress):** the user pasted a long ChatGPT-style "Designing a Complete IFRS 9 Forward-Looking Information (FLI) Module for MAIIC" proposal and asked: "what do u think about this ets do a spec document for that".

2. Key Technical Concepts:
   - Laravel 10, Inertia, Vue 3, Tailwind (maiic/maiicgold palettes), spatie/permission (role `admin`; permissions `eir.view`, `eir.govern`, `eir.export`, `settings`, `reports.ifrs9`, `macro.view`), maker-checker governance (Governance Centre, governed settings as at a date), fail-closed engines with no proxy fallbacks.
   - IFRS 9: 5.5.17 (unbiased probability-weighted, time value, reasonable and supportable), B5.5.42–B5.5.54 FLI, B5.5.44 floating-rate current EIR discount, Stage 1 12-month / Stage 2 lifetime / Stage 3 credit-impaired, B5.5.17 qualitative SICR, IFRS 7 note.
   - The MAIIC FLI chain: Macro Statistics (macro_statistics, macro_statistics_data, macro_series bridge, macro_source_import_batches) → `fli:correlate` (CorrelationFinder, RegressionEngine, Guardrail; tables analysis_runs, fli_relationships, fli_fits, fli_suggestions, credit_loss_series) → fit proposed/approved (FliRouteService::proposeFit/approveFit) → governed scenario sets (governed_scenario_sets, governed_scenarios, scenario_shocks; ScenarioSetService; weights Base 50/Upside 15/Downside 25/Severe 10; rules ≥3 scenarios, base ≥40%, no weight >60%) → `fli:apply` writes `pd_post_fli`, `fli_adj`, `fli_route`, `fli_method`, `fli_fit_id`, `fli_set_id` → ECL via `ifrs9:segment-ecl --pd=pd_post_fli`. `pd_prefli` = PD engine output; `pd_value` = legacy, not used. AsAtSeries (app/Support/Fli/AsAtSeries.php) enforces as-at-date reads; lag applied; route books the PD that reproduces the weighted ECL (exact only while FLI moves PD alone).
   - Empty existing tables usable for the FLI spec: ecl_projection_runs, ecl_pd_term_structures, ecl_cashflow_projections, ecl_recovery_cashflows; services EclDiscountingService, EclDiscountRateService (floating loans discounted at original EIR as labelled proxy `EIR_ORIGINAL_FLOATING_PROXY`), TimePhasedEclService, TransmissionMethodCatalogue (scalar, segment scalar, nine reference methods, logit-linear, Vasicek Z-shift), OverlayService.
   - Spec v4 (docs/MAIIC_EIR_Engine_Specification_v4_2026-10-07.md, maintained by the colleague's session): §13 macro statistics, §14 forward-looking (14.3–14.10, 14.7 transmission method), §15 scenarios (15.5 weight the loss), §16 Mega Farm, §3.6 staging, §3.8 status H write-offs.
   - Spec renderer: `python spec_render.py "<path to .md>"` writes .docx and .pdf beside the .md; front matter `---` block with keys kicker, title, subtitle, date, prepared, people, status; supports ##/### headings, paragraphs, `- ` bullets, `1. ` lists, pipe tables, **bold**, *italic*, `code`. Located at `C:\Users\DELL\OneDrive\2026\Projects\MAIIC\2. Documents from clients\Raw Query Scripts\Query Requests to MAIIC\Build files\2026-10-09\spec_render.py`. Specs folder: `...\MAIIC\3. Project Execution\specs\`.

3. Files and Code Sections (most relevant recent ones):
   - `app/Services/Maintenance/CommandRunner.php` (new, ported from Stress-Testing-App): launches `php artisan <cmd>` detached via a .bat (Windows) writing to `storage/app/command-runs/<id>.log` with sentinel `===EXIT:n===`; `status()`, `recent()`, plus added `running()` (one command at a time).
   - `app/Http/Controllers/MaintenanceController.php` (new): whitelist catalogue grouped setup (bootstrap `eir:bootstrap --fresh --force-wipe --with-client-inputs --build --run-engines --verify --user={user}` destructive confirm `BOOTSTRAP`; `migrate --force`; seeders MaiicAdminPermissionsSeeder, GovernanceSettingsSeeder, SicrQualitativeFactorsSeeder), month (with `{period}`: `eir:build-loan-books`, `eir:stage --user`, `ifrs9:segment-parameters --user`, `fli:correlate`, `fli:apply --user`, `ifrs9:segment-ecl --pd=pd_post_fli`, `eir:run-revenue --user`, `megafarm:ecl --user`), imports (`macro:import-worldbank`, `eir:poll-feed-folder`), diagnostics (`about`, `migrate:status`, `eir:baselines`, `ifrs9:smoke-reports`). Period validated `^\d{4}-(0[1-9]|1[0-2])$` and must have a loan book (except build); refuses while a run is running; audit via `AuditLoggerService::log('Maintenance Command Launched','maintenance',...)`.
   - `resources/js/Pages/Admin/Maintenance.vue` (new): tabs First-time setup/Month-end/Imports/Diagnostics/Run history with counts, month picker (held months plus next month), cards showing command, confirmDialog for caution/destructive, typed phrase for destructive, output drawer with polling (`<pre class="... whitespace-pre bg-gray-950 ...">`), history paged at 15.
   - `routes/web.php`: maintenance group (`auth`, `permission:settings`; run additionally `role:admin`; output `where id [A-Za-z0-9\-]+`); Reports hub route moved out of the reports.ifrs9 group with `permission:reports.ifrs9|reports|eir.view`; stageing-rules routes redirect to `settings.index?tab=staging`.
   - `config/menu.php`: sections/tabs (`$tab($name,$route,$permission,$params)`, `$section`), Reports single hub leaf, Macro Statistics own section, Forward-Looking Model = Correlation Finder | Regression; Scenarios & Overlays = Scenario Sets | Manual Overlays; Administration has Users & Roles, Financial Periods, Audit, Support Tickets, Settings, Maintenance (permission settings), Legacy FLI tools (7 tabs).
   - `resources/js/Pages/Dashboard.vue`: charts section moved before the "ECL BUILD-UP AND WHERE IT SITS" section; PDF button now:
     ```html
     <a :href="reportPdfUrl" title="Download the dashboard for the chosen period, portfolio and compare-to month as a PDF"
        class="inline-flex items-center gap-1.5 self-center rounded-lg bg-maiicgold-400 px-3 py-1.5 text-xs font-bold text-maiic-900 shadow-sm ring-1 ring-maiicgold-500/40 transition hover:bg-maiicgold-500">
         <svg class="h-3.5 w-3.5" ...></svg> PDF
     </a>
     ```
   - `app/Services/Fli/RegressionEngine.php` (b6e6baf): inputs_hash now includes guardrail settings; identical fit reused (`'reused' => $existing !== null`); test added in `tests/Feature/FLI/AsAtReportingDateTest.php` (`test_a_re_sweep_on_the_same_inputs_reuses_the_fit_instead_of_copying_it`).
   - `app/Http/Controllers/ExpectedCreditLossController.php` (70b7333): fail-closed guard before the recalculation when exposed loans lack stage/PD/LGD (throws RuntimeException in console, redirects with error on web).
   - `app/Services/Reports/Ifrs9NoteService.php` (698152e): `stagingBands($period)` reads staging_thresholds in force (91 short-term, 181 medium/long-term, 91 Mega Farm) instead of retired finance_stageing_rules.
   - `docs/manuals/installation/09-data-loading.md`: new §9.9 month-end run table (13 steps, screens and commands) (a222b77).
   - `app/Support/SectionTabCounts.php`, `resources/js/Jetstream/menuMatch.js` (activeTab with params match/default), `resources/js/Layouts/AppLayout.vue` (section tab bar below header with `tabCount(tab)` from `$page.props.tabCounts`), `app/

```
Http/Middleware/HandleInertiaRequests.php` (tabs filtered by permission; flash warning/info shared; menu annotated with counts).
   - `docs/MAIIC_EIR_Engine_Specification_v4_2026-10-07.md` front matter (pattern to follow for the new spec):
     ```
     ---
     kicker: MAIIC | IFRS 9 EFFECTIVE INTEREST RATE ENGINE
     title: Specification, version 4
     subtitle: ...
     date: 7 October 2026
     prepared: Prepared by Dupleix Institute for the Malawi Agricultural and Industrial Invest

[... 11,801 characters cut here; the full text is in the session log kept with this transcript ...]

verned_scenario_sets, governed_scenarios, scenario_shocks, fli_fits, fli_relationships, fli_overlays, ecl_projection_runs,
ecl_pd_term_structures, ecl_cashflow_projections, ecl_recovery_cashflows, contract_eir, contract_cashflow_schedule,
expected_credit_loss), new tables only where needed.
   - Phased build plan with acceptance tests; open questions for Dr Thom/MAIIC (RBM industry NPL data, scenario owner and
cadence, weights, LGD FLI for agri collateral, floating-rate discount basis).

9. Optional Next Step:
   Write the spec as `docs/MAIIC_FLI_Module_Specification_v1_2026-10-13.md` in `C:\xampp\htdocs\MAICC-IFRS9` using the v4
front-matter keys (kicker, title, subtitle, date 13 October 2026, prepared, people, status), with sections covering: verdict on
the proposal, IFRS 9 requirements, what MAIIC has today vs the proposal (gap table), decisions D-F1 to D-F12, target design
(cadence, UI with the seven FLI tabs, data model mapped to existing tables plus minimal new ones, engine per-scenario ECL/term
structure/Stage 3/discounting, controls, reports/workbooks), phased build plan with acceptance tests, and open questions for Dr
Thom; ASCII hyphens only. Then render with `python "<...>/Build files/2026-10-09/spec_render.py" "<md path>"`, copy the .md/
.docx/.pdf to `C:\Users\DELL\OneDrive\2026\Projects\MAIIC\3. Project Execution\specs\`, commit the .md (own file only) and push
to `eir_revenue_recognition` with `GIT_TERMINAL_PROMPT=0 timeout 120 git push`, and send the PDF to the user with SendUserFile.
This directly follows the user's latest request: "what do u think about this ets do a spec document for that".

If you need specific details from before compaction (like exact code snippets, error messages, or content you generated), read
the full transcript at: C:\Users\DELL\.claude\projects\c--xampp-htdocs-Stress-Testing-App\
c9a0f915-2064-4f18-9b98-77857ef71421.jsonl
Continue the conversation from where it left off without asking the user any further questions. Resume directly — do not
acknowledge the summary, do not recap what was happening, do not preface with "I'll continue" or similar. Pick up the last task
as if the break never happened.

The messages after this summary are the most recent messages from before compaction, kept verbatim. The summary was written
without seeing them, so something it says has not happened yet may already have happened in them.
```

## CLAUDE (2026-10-13 08:30:48 UTC)

The draft is written. Before rendering, I'm checking the figures it quotes against the demo database.

### Tool call: Bash

```
description: Check the fit, floating contracts and August ECL in the demo database
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && M="/c/xampp/mysql/bin/mysql -uroot maiic_ifrs9_demo -e"
$M "SELECT id, statistic_code, proxy_code, lag_months, r_squared, n_obs, status FROM fli_fits WHERE status='approved' ORDER BY
id;" 2>&1 | head -20
$M "SHOW COLUMNS FROM contract_eir;" 2>&1 | grep -i -E "float|rate_type|variable"
$M "SELECT reporting_period, ROUND(SUM(ecl_amount)/1e9,3) FROM expected_credit_loss WHERE reporting_period IN ('2026-08',
'202608') GROUP BY reporting_period;" 2>&1
```

```

CLAUDE (2026-10-13 08:31:17 UTC)

Every figure matches: pre-FLI 11.76 billion, FLI effect minus 0.44 billion, booked 11.31 billion. One last check on the PLR range the spec quotes.

Tool call: Bash

```
description: Read the PLR series range in the demo database
--- command ---
/c/xampp/mysql/bin/mysql -uroot maiic_ifrs9_demo -e "SELECT observation_period, value FROM macro_series WHERE
statistic_code='PLR' AND value_type='actual' ORDER BY observation_period;" | awk 'NR==2||NR>1{a[NR]=$0} END{print a[2];
for(i=NR-3;i<=NR;i++) print a[i]}'
/c/xampp/mysql/bin/mysql -uroot maiic_ifrs9_demo -e "SELECT MIN(value), MAX(value) FROM macro_series WHERE statistic_code='PLR'
AND value_type='actual' AND observation_period BETWEEN '202407' AND '202608';"
```

Result of Bash

```
202003    13.400000
202605    20.600000
202606    20.400000
202607    20.500000
202608    20.800000
MIN(value)    MAX(value)
20.400000    25.400000
```

CLAUDE (2026-10-13 08:31:22 UTC)

The PLR peak is 25.4, not 25.3, so I'm correcting that line and rendering.

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\docs\MAIIC_FLI_Module_Specification_v1_2026-10-13.md
--- old_string ---
follows the PLR's decline from 25.3 to 20.8 percent
--- new_string ---
follows the PLR's decline from a peak of 25.4 percent to 20.8 percent in August 2026
{
 "replace_all": false
}
```

Tool call: Bash

```
description: Check for dashes and render the spec to Word and PDF
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && grep -c $'\xe2\x80\x94\|\xe2\x80\x93' docs/MAIIC_FLI_Module_Specification_v1_2026-10-13.md;

Designing a Complete IFRS 9 Forward-Looking Information (FLI) Module for MAIIC Bank

For a bank such as MAIIC in Malawi, I would design Forward-Looking Information (FLI) as a fully integrated, auditable modelling module within the IFRS 9 system, rather than a page where users simply upload GDP, inflation and other macroeconomic variables and enter an adjustment percentage.

The objective is to allow the bank to perform its IFRS 9 calculations every month, review and update its economic outlook, conduct a comprehensive annual model review, and retain the complete history of what was used to calculate each reporting period's Expected Credit Loss (ECL).

Because your system already calculates Effective Interest Rates (EIR) and discounts expected repayments, FLI must connect directly to the bank's PD, LGD, EAD and expected-cash-flow calculations without incorrectly changing the EIR or double-counting credit losses.

1. What IFRS 9 actually requires

IFRS 9 paragraph 5.5.17 requires Expected Credit Loss to reflect three fundamental elements:

1. An unbiased, probability-weighted amount considering possible outcomes.
2. The time value of money.
3. Reasonable and supportable information about historical events, current conditions and future economic forecasts.

Importantly, IFRS 9 does not prescribe a particular statistical model, a fixed number of economic scenarios, or a universal FLI adjustment formula. Those are modelling choices the bank must support, validate and document.

[image](https://www.google.com/s2/favicons?domain=https://www.ifrs.org\&sz=32)

IFRS

+2

For MAIIC, I would use this architecture:

Proposed IFRS 9 calculation architecture

Macroeconomic Data & Forecasts

GDP, inflation, policy rates, exchange rates and relevant sector indicators

Baseline

50%

Upside

20%

Downside

30%

Illustrative scenario weights only — bank-approved probabilities required

FLI Transmission Models

Translate macroeconomic forecasts into future portfolio credit risk

PD & Staging

LGD / Recoveries

EAD / Utilisation

Scenario-Level ECL Calculation

Expected contractual cash shortfalls discounted using the applicable IFRS 9 EIR

Probability-Weighted Final ECL

Saved with the reporting period, model versions, scenario assumptions, approvals and audit trail

The most important distinction is that FLI changes expectations about credit risk and cash recoveries, while EIR determines the discounting of the resulting cash shortfalls.

You should therefore build FLI and EIR as connected but separately controlled calculation services.

2. How frequently the bank should perform FLI

I would separate annual modelling from monthly ECL processing.

Activity	Frequency	How it should work
Economic data updates	Monthly or when new data becomes available	Import published actuals and revised forecasts
Scenario review	Every reporting month	Confirm that existing forecasts and weights remain appropriate
FLI model recalibration	At least annually, plus event-driven	Re-estimate macroeconomic relationships and test model performance
FLI scenario approval	Each new or materially revised scenario set	Risk/Finance review with maker-checker approval
ECL calculation	Every month-end	Use approved FLI assumptions applicable to that date
EIR calculation	Origination, with required subsequent accounting adjustments	Preserve original EIR and applicable rate history
EIR-based ECL discounting	Every ECL run	Discount future cash shortfalls to reporting date
Backtesting	Monthly monitoring, deeper annual validation	Compare earlier forecasts with actual outcomes

One crucial point: the bank should not automatically reuse January's forecasts for December without evaluating whether they remain reasonable at December's reporting date.

Monthly ECL calculations should always reference an approved, reporting-date-appropriate economic outlook, even if the bank decides that an existing forecast set remains suitable.

3. How I would design the FLI module user interface

I would introduce a separate top-level Forward-Looking Information menu in the IFRS 9 system.

Rather than putting everything on one very long page, I would use a dashboard, a guided scenario workbench and a set of dedicated modelling screens.

Current forecast vintage

2026-10 v1

Approval and publication tracked

Month-end controls

Data completeness → Model validation → Scenario approval → ECL run

The individual screens should work as follows.

Screen A — Economic Indicators

This is where bank users manage macroeconomic information from sources such as the Reserve Bank of Malawi, National Statistical Office, IMF and World Bank.

It should support importing both historical actuals and future forecasts, but maintain a clear distinction between them.

Example data table (all values below are illustrative, not actual Malawi forecasts):

Indicator	2024 Actual	2025 Actual	2026 Forecast	2027 Forecast
Real GDP growth	2.0%	2.5%	3.2%	4.1%
Inflation	27.0%	23.0%	20.0%	16.0%
Policy rate	26.0%	25.0%	23.0%	21.0%
Exchange rate change	18.0%	14.0%	12.0%	9.0%

Every observation should include its source, release date, reporting period, unit, observation type (actual, estimate or forecast), and the date it became available to the bank.

That last requirement is important for historical reproducibility. A forecast published in October 2026 must not silently replace the forecast that was actually available when the bank closed its accounts in March 2026.

The UI should offer Excel/CSV import, manual entry, validation, historical charts, source-document attachments and revision comparisons.

Screen B — Scenario Workbench

This is where the bank constructs future economic conditions.

Here is an interactive example of how I would organize that screen. The percentages and FLI impacts are simulated to demonstrate the design, not MAIIC model outputs.

Scenario Workbench

Economic assumptions and scenario probabilities

Draft simulation

Reporting periodOctober 2026

Forecast horizon

2026–2028

Scenario probabilities

Upside

20%

Baseline

50%

Downside

30%

Total probability

100%

Economic scenario forecasts

UpsideBaseDownside

Indicator	2026	2027	2028
GDP growth	3.2%	4.1%	4.5%
Inflation	20.0%	16.0%	13.0%

This interactive prototype is for exploring the interface. It does not save changes to a bank database or calculate a validated FLI model.

In the actual system, I would also include monthly forecasts, charts comparing scenario trajectories, an economic rationale field, forecast-source attachments and model-generated scenarios that can be reviewed before approval.

Users must be able to save drafts without affecting previous approved forecasts.

Screen C — Model Calibration

This is arguably the most important screen.

Many IFRS 9 implementations do not model the statistical relationship between economic conditions and credit defaults adequately. Instead, they apply an arbitrary PD uplift.

The screen should allow the bank to examine how macroeconomic variables affect credit risk, for example by estimating:

\\[\operatorname{logit}(PD_{s,t}) = \beta_0+\beta_1 GDP_{s,t} +\beta_2 Inflation_{s,t} +\beta_3 Rate_{s,t} \\]

Here \\(s\\) represents the scenario and \\(t\\) the forecast period.

This is an example of a possible model specification, not a prescribed IFRS 9 formula. The bank could instead use a transition-matrix model, survival model, satellite model, calibrated multipliers or another validated method.

I would design the calibration page around three panels:

- Data selection: choose portfolio, historical default observations, macroeconomic variables, date range and lags.
- Model evaluation: coefficients, confidence intervals, predictive accuracy, economic plausibility, stability, backtesting results and diagnostic tests.
- Model publication: version, effective date, validation documents, approval and whether it is authorized for production ECL.

For example:

Model	Portfolio	Proposed macro drivers	Status
PD-FLI-01	Retail loans	GDP, inflation	Example only
PD-FLI-02	SME loans	GDP, rates, FX	Example only
LGD-FLI-01	Secured loans	Collateral prices, recovery conditions	Example only

The choice of macroeconomic variables must be justified by historical evidence, economic reasoning and the portfolio's risk characteristics.

Importantly, the system should support segment-specific model configurations rather than assuming the same GDP sensitivity across every loan type.

Screen D — FLI Impact Analysis

Before approving new assumptions, users should compare the current proposed FLI output with the previously approved assumptions.

FLI Impact Analysis

Downside (30%)	MWK 16.00bn
Probability-weighted	MWK 11.90bn

Scenario-weighted result: (8 × 20%) + (11 × 50%) + (16 × 30%) = MWK 11.90bn. The simulated summary above should therefore display MWK 11.90bn and +19.0%; the independently illustrative summary figures are not the reconciliation result.

In the production dashboard, all headline metrics must come directly from the same calculated results table to avoid any discrepancy between KPIs, charts and detailed workings.

The impact screen should also explain changes by portfolio, stage, scenario, macroeconomic driver, model version and manual adjustment. Users should be able to drill down to individual facilities.

4. Database design — the tables I would create

For a Laravel and MySQL-based IFRS 9 platform, I would organize the database into five groups. These are logical tables rather than an exhaustive physical schema.

A. Macroeconomic data tables

Table	Important columns	Purpose
`macro_variables`	id, code, name, unit, frequency, country, active	Master list of economic variables
`macro_observations`	variable_id, period, value, value_type, source_id, release_date, vintage_id	Historical actuals, estimates and forecasts
`macro_sources`	id, institution, publication, reference_url	Stores the origin of economic information
`macro_import_batches`	id, filename, checksum, imported_by, status, errors	Tracks imports and data-quality checks
`macro_vintages`	id, as_of_date, published_at, source_version	Preserves historical forecast releases

The observations table might contain:

Variable	Period	Value	Type	Forecast vintage
GDP	2025	2.5%	Actual	2026-10
GDP	2026	3.2%	Forecast	2026-10
GDP	2027	4.1%	Forecast	2026-10
Inflation	2026	20.0%	Forecast	2026-10

All figures here are examples.

The critical design rule is that one variable can have multiple observations for the same period from different published vintages, but an ECL run must reference exactly which value and vintage it used.

B. Scenario tables

Table	Important columns	Purpose
`fli_scenario_sets`	id, reporting_date, vintage_id, version, status	A complete set of scenarios for a reporting date
`fli_scenarios`	id, scenario_set_id, name, probability, narrative	Base, upside, downside or other scenarios
`fli_scenario_values`	scenario_id, variable_id, forecast_period, value	Monthly/annual economic forecasts
`fli_scenario_weights`	scenario_id, segment_id, weight, valid_from	Optional segment-specific weights where justified
`fli_scenario_reviews`	set_id, reviewer, decision, rationale, reviewed_at	Governance and scenario review

I would treat the scenario set as the versioned container of all assumptions used in a particular month-end.

Once published, a scenario set should be immutable. Revisions create a new version rather than modifying an old approved record.

C. FLI model tables

Table	Important columns	Purpose
`fli_models`	id, target_metric, segment_id, methodology	Defines PD, LGD or EAD transmission model
`fli_model_versions`	id, model_id, version, calibration_date, status	Version-controlled specifications
`fli_model_coefficients`	model_version_id, variable_id, lag, coefficient	Estimated macroeconomic sensitivities
`fli_model_diagnostics`	model_version_id, metric, value, result	Validation and backtesting results
`fli_model_assignments`	segment_id, target_metric, model_version_id	Maps model to portfolio
`fli_overlays`	id, scenario_set_id, segment_id, rationale, amount_or_factor, status	Separately approved expert overlays

Additional tables should preserve calibration samples, data transformations, forecast methodologies, coefficient uncertainty and independent validation results.

D. Scenario-specific credit risk calculations

Table	Important columns	Purpose
`fli_projection_runs`	id, scenario_set_id, run_date, status	A complete FLI projection run
`fli_pd_term_structures`	run_id, segment_id, scenario_id, period, marginal_pd, survival_probability	Future probabilities of default
`fli_lgd_projections`	run_id, scenario_id, segment_id, period, lgd	Scenario-adjusted recovery severity
`fli_ead_projections`	run_id, scenario_id, facility_id, period, ead	Projected outstanding exposure
`fli_sicr_assessments`	run_id, facility_id, origination_risk, current_lifetime_risk, stage, reason	Forward-looking staging assessment
`fli_ecl_results`	ecl_run_id, facility_id, scenario_id, stage, ecl_amount	Scenario-level ECL
`fli_weighted_ecl`	ecl_run_id, facility_id, weighted_ecl	Final probability-weighted ECL

For very large loan books, do not store all facility-level term structures in one unpartitioned table. Use reporting-date partitioning, appropriate compound indexes and separate aggregate results from detailed calculation evidence.

E. EIR and cash-flow integration tables

These are especially relevant because your platform already handles effective interest calculations and discounted repayment profiles.

Table	Important columns	Purpose
`eir_calculations`	facility_id, original_eir, rate_basis, calculation_version, status	Initial EIR calculation and lineage
`eir_rate_history`	facility_id, effective_date, applicable_eir, reason	Relevant variable-rate or modification-related rate history
`contractual_cashflows`	facility_id, due_date, principal, interest, eligible_fees	Contractual payment schedule
`expected_cashflow_scenarios`	facility_id, scenario_id, payment_date, expected_receipt, recovery_type	Scenario-specific expected receipts
`discounted_cashflows`	ecl_run_id, facility_id, scenario_id, date, discount_rate, discount_factor, present_value	Discounted cash-flow evidence
`ecl_run_snapshots`	ecl_run_id, loanbook_id, fli_set_id, pd_version, lgd_version, eir_version	

```
Complete reproducibility record                          |
```

For performance, detailed scenario cash flows can also be stored in partitioned calculation-result tables, provided the bank retains auditable calculations.

A useful database design principle is that every ECL result has a traceable path to the source loan, approved scenario set, model versions, projected cash flows and EIR used.

5. End-to-end workflow for monthly IFRS 9 reporting

I would create a single guided workflow, rather than requiring bank users to visit seven unrelated pages and remember which tasks must be completed.

1. Create month-end reporting period

Select October 2026, establish cutoff date and lock the reporting context.

2. Load and validate source data

Import the loan book, repayment transactions, contractual cash flows, write-offs, recoveries and available macroeconomic updates.

3. Review economic assumptions

Check actual economic data, forecast revisions, scenario weights, relevant stress events and existing model suitability.

4. Run FLI projections

Calculate scenario-sensitive PD, LGD, EAD and lifetime credit risk. Run quality controls and model coverage checks.

5. Calculate staging, EIR and ECL

Assess SICR, apply the appropriate stage, calculate credit shortfalls and discount them using the applicable EIR.

6. Review results and reconcile

Compare ECL movements against the prior month, including portfolio, stage, balance, model, scenario and overlay impacts.

7. Approve and close

Risk and Finance approve the results, the reporting snapshot is frozen, and audit workbooks and reports become available.

The user should see the readiness of each step, with a clear explanation of any failure.

For example, if October's loan book is available but the model has no approved October-applicable FLI assumptions, the system should not silently default to historical PDs and produce a final official result.

It should show an explicit exception requiring approval of suitable assumptions.

6. Annual FLI review: what happens differently?

The annual FLI process should have a dedicated Model Review & Recalibration workflow, separate from the monthly scenario review.

During the annual cycle, the bank should be able to upload new years of historical default data, evaluate additional macroeconomic variables, rebuild modelling datasets, recalibrate candidate models and compare them against the current approved models.

The annual workbench should include out-of-time validation, observed-versus-predicted default rates, scenario sensitivity, parameter stability, portfolio segmentation and model limitations.

A new model should follow a controlled lifecycle:

```
Draft → Calibration → Validation → Risk Review → Approval → Published
```

The bank should be able to compare the revised model with the previous version using the same loan-book snapshot before publishing it.

Annual recalibration is not a reason to rewrite old figures. The December 2025 approved reporting results must remain reproducible even after a new model is introduced for 2026.

7. How FLI should interact with PD, LGD, EAD, EIR and repayments

This is the area where I would be particularly careful with the MAIIC implementation.

A. FLI and probability of default

Suppose a retail portfolio has a historically calibrated 12-month PD of 5%.

Once macroeconomic forecasts are applied, its conditional probabilities might change:

Scenario	Conditional 12-month PD
Upside	3.5%
Base	5.0%
Downside	8.0%

Using illustrative weights of 20%, 50% and 30%, the weighted PD would be:

\\[PD_{\mathrm{weighted}} =0.20(3.5\\%)+0.50(5\\%)+0.30(8\\%) =\boxed{5.6\\%} \\]

However, this is a simplified one-period calculation.

For actual Stage 2 lifetime ECL, I would not multiply the initial 12-month PD by the remaining number of years or blindly apply one uplift to a lifetime PD.

The engine should generate a scenario-specific marginal PD term structure, including survival probability and defaults in each future period.

B. FLI and LGD

For secured facilities, economic forecasts can influence expected recovery values, recovery costs and the timing of collateral realization.

The LGD model might generate:

Scenario	Illustrative LGD
Upside	30%
Base	35%
Downside	45%

If the existing LGD calculation already embeds adverse collateral assumptions, applying another downside adjustment to the same risk can double-count losses.

The bank should clearly identify which risk drivers are already included in historical LGD and which are introduced through FLI.

C. FLI and EAD

EAD generally follows expected outstanding exposures, scheduled amortization and, where relevant, future drawings and credit conversion factors.

For a fully drawn amortizing term loan, the expected balance may decline each month according to the repayment profile.

For an overdraft or revolving exposure, stressed economic conditions might affect drawings, utilization and future exposures.

The FLI engine therefore needs to connect to the facility-level repayment schedule rather than assume that every loan maintains its current outstanding balance until maturity.

D. FLI and EIR

Here is the distinction I would preserve in the architecture.

Item	What it represents	How FLI affects it
EIR	Effective financing yield determined under IFRS 9	FLI does not ordinarily change original fixed-rate EIR
Contractual cash flows	Payments due under the loan contract	Not directly rewritten merely because the economic outlook changes
Expected cash flows	Amounts and timing expected to be received	Can change under different economic scenarios
Discount factor	Converts future cash flows to reporting-date value	Uses the appropriate IFRS 9 discount rate
ECL	Present value of expected credit shortfalls	Changes with scenario-specific default and recovery expectations

Under IFRS 9, ECL is generally discounted using the EIR determined at initial recognition or an appropriate approximation. Floating-rate instruments and purchased or originated credit-impaired assets have particular rules that must be handled separately.

[image](https://www.google.com/s2/favicons?domain=https://www.ifrs.org\&sz=32)

IFRS

+1

Do not apply the current Malawi policy rate as the ECL discount rate simply because it is part of the FLI forecast.

The policy rate may explain how credit risk evolves. It does not replace the facility's IFRS 9 EIR.

E. How FLI and discounted repayments should work together

Consider a simplified example.

A loan has a 12% annual effective interest rate, a contractual payment of MWK 110,000 in one year, and the following possible expected payments:

Scenario	Expected receipt	Cash shortfall
Upside	MWK 108,000	MWK 2,000
Base	MWK 100,000	MWK 10,000
Downside	MWK 80,000	MWK 30,000

For this simple annual example:

$$ PV(\text{shortfall}_s) =\frac{\text{Contractual CF}-\text{Expected CF}_s}{1+EIR} $$

The discounted ECL per scenario becomes approximately:

Scenario	Discounted ECL
Upside	MWK 1,786
Base	MWK 8,929
Downside	MWK 26,786

With the same 20%, 50% and 30% weights:

$$ ECL_{\mathrm{weighted}} =0.20(1,786)+0.50(8,929)+0.30(26,786) $$

$$ \boxed{ECL\approx MWK\ 12,857} $$

This illustrates the correct relationship: the economic scenarios influence the expected receipts, while the applicable EIR discounts the resulting shortfalls.

For real loan portfolios, calculations require individual payment dates, actual day counts, expected recovery dates, default timing, staging and the bank's approved cash-flow methodology.

F. Stage 1, Stage 2 and Stage 3 treatment

I would implement the stage-specific treatment as follows:

Stage	FLI application	Calculation basis
Stage 1	Forward-looking 12-month default risk	Lifetime cash shortfalls arising from defaults possible in the next 12 months
Stage 2	Forward-looking lifetime default risk	Cash shortfalls arising from defaults possible over expected life
Stage 3	Forward-looking cash recovery assumptions	Probability-weighted discounted expected credit shortfalls for credit-impaired exposures

For Stage 1, remember that a 12-month ECL is not necessarily the cash shortfall occurring within the next 12 months. It includes lifetime shortfalls associated with defaults that could occur during that 12-month default window.

For Stage 2, a simplified discrete-time approach is:

$$ ECL_s = \sum_{t=1}^{T} mPD_{s,t}\times LGD_{s,t}\times EAD_{s,t}\times DF_t $$

Where mPD is the marginal probability of default for period t, accounting for survival to that period.

The final provision is:

$$ ECL_{\mathrm{final}}=\sum_{s=1}^{S}w_sECL_s $$

This PD/LGD/EAD expression is an approximation requiring consistency with the contractual cash-shortfall definition and recovery timing.

For Stage 3, especially where MAIIC already calculates discounted repayments and recoveries, I would make the cash-flow shortfall approach the primary valuation method whenever reliable facility-level projections exist:

$$ ECL_s = PV(\text{Contractual CF}) - PV(\text{Expected CF}_s) $$

The precise implementation must reconcile to the asset's gross carrying amount under IFRS 9. It should not automatically multiply an already credit-impaired facility's discounted shortfall by a separate PD that would recognize the same default risk again.

Also, if a Stage 3 expected cash-flow model already reflects recoveries from security, the system must not deduct the same collateral benefit a second time.

This is why I would build one shared cash-flow and discounting service used by all stages, with the appropriate stage-specific ECL methodology.

8. Controls and reconciliation I would make compulsory

An IFRS 9 FLI module should have proper audit controls from the beginning, not added after an audit identifies issues.

These are the most important automated checks:

Control	Expected action
Scenario probabilities do not total 100%	Block scenario publication
Forecast is missing for a required period	Flag missing information and block an unsupported official run
Unapproved model version selected	Block official ECL
Loan has no valid EIR or applicable discount rate	Flag for controlled resolution, not silent zero
Facility has no portfolio model assignment	Report unmapped exposure
Scenario PD outside valid probability bounds	Block invalid results
Inconsistent monthly/annual macro units	Block until corrected
Scenario already includes a risk also applied as overlay	Require double-counting review
ECL differs significantly from prior period	Require investigation and commentary
Approved forecast subsequently revised	Retain old version and create a new one

The bank should also have an ECL movement reconciliation showing opening ECL, balance movements, new facilities, derecognition, stage transfers, changes in credit risk, FLI movements, recoveries and other relevant adjustments.

For the illustrative FLI dashboard above, the reconciled scenario-weighted ECL is MWK 11.90 billion, representing a 19.0% increase over MWK 10.00 billion before FLI. Those are the values the headline KPIs should display.

9. Reports and Excel audit workbooks

I would make the following exports available from the FLI module:

- Macroeconomic Data Workbook: historical actuals, forecasts, source references and revisions.
- Scenario Workbook: upside, baseline and downside paths, weights and rationale.
- Model Calibration Workbook: datasets, coefficients, model diagnostics and validation results.
- PD/LGD/EAD FLI Workbook: scenario-specific projected risk parameters and term structures.
- EIR & Discounted Cash-Flow Workbook: contractual payments, expected receipts, discount factors and present values.
- FLI Impact & ECL Reconciliation Workbook: weighted ECL, movements, stage changes and driver attribution.
- Approval & Audit Workbook: users, timestamps, model versions, scenario versions and signed-off decisions.

Each export should include a report-date identifier and run ID so that someone reviewing the 31 October 2026 report can reproduce its workings without using revised November assumptions.

10. How I would implement this in your Laravel IFRS 9 system

I would separate the calculation engine into services with explicit inputs and outputs.

Service	Responsibility
`MacroDataService`	Validates macroeconomic observations and vintages
`ScenarioSetService`	Manages forecasts, scenario weights and approvals
`FliCalibrationService`	Calibrates and validates credit risk relationships
`FliProjectionService`	Generates scenario-specific PD, LGD and EAD
`SicrAssessmentService`	Determines forward-looking credit deterioration and staging
`EirCalculationService`	Determines and maintains applicable EIR
`CashflowProjectionService`	Constructs contractual and scenario-dependent expected cash flows
`DiscountingService`	Calculates present values using IFRS 9 discount conventions
`EclCalculationService`	Calculates scenario ECL and probability-weighted provision
`EclReconciliationService`	Attributes changes in ECL and produces audit evidence

The complete process should look like this:

Loan Book + Repayment Schedules + Macro Data

EIR Engine

Rates, amortized cost, discount conventions

FLI Engine

Forecasts, scenarios, PD, LGD, EAD

Staging + Expected Cash-Flow Engine

Time-dependent defaults, scheduled receipts and recoveries

Scenario-Specific Discounted ECL

Weighted Final ECL + Audit Evidence

Month-end results, reconciliation, approval and reporting

11. What I would prioritize for MAIIC

Given that the system already has an EIR engine and discounted repayment calculations, I would not rebuild those parts merely to add FLI.

I would implement the following in order:

1. Build the macroeconomic data and scenario management module, including source data, historical forecast vintages, probability weights and approvals.
2. Build the model calibration and projection engine, initially focusing on PD and adding scenario-sensitive LGD/EAD where material and supportable.
3. Integrate the projections into staging and the existing cash-flow engine, ensuring EIR discounting is preserved and credit losses are not counted twice.
4. Introduce a monthly FLI review and close workflow, so users can update forecasts, compare ECL impacts and authorize a reporting run.
5. Add independent validation, backtesting, reconciliation and audit exports, including full traceability from macroeconomic forecasts to facility-level ECL.

The key design decision is that the FLI module should not merely produce an adjusted PD percentage. It should produce a versioned, approved, scenario-specific credit risk projection that the ECL engine can consume for the appropriate reporting date.

That will allow MAIIC to perform monthly ECL calculations while maintaining a controlled annual modelling process, and it will make the connection between forward-looking assumptions, EIR, discounted repayments and final provisions transparent to auditors.

The methodology should ultimately be aligned to MAIIC's approved accounting policy, validated using its loan and default history, and reviewed against IFRS 9 and applicable Malawi regulatory requirements. The EBA's guidance is also a useful reference for model governance, validation and the treatment of forward-looking economic information, although it is not itself Malawi regulation.

8f43e5d Maintenance console: setup, month-end, import and check commands run from the browser with live output; the dashboard
PDF button made small
698152e Quantitative Thresholds retired; the IFRS 9 note states the staging thresholds the engine applies
d823650 Legacy FLI tools: a one-line notice on each screen that it is not used by the ECL, breadcrumbs under Administration
e9f1f98 Menu: the forward-looking model is the governed chain; legacy FLI tools move to Administration
3182139 Macro Statistics is its own menu entry: its five views are the section's only tab row, with real counts
e64d460 Imports and feeds: one tab row, paged tables, import screens with instructions, sample CSV and history
6fc9398 One tab row per section: inner views join the section row; shared table and button styles defined once
4719d28 Tabbed sections and a TNM-style sidebar: Reports as one hub entry, related screens as tabs, coloured icons
4fd3dd5 The MAIIC layout restored: the contract-aligned menu, the old sidebar and header, buttons top right
3447b4f Merge branch 'step8-engines' into eir_revenue_recognition
de2ea11 M6: the legacy regression chain retired behind the reports permission (audit finding M6)
84a286a The manual-overlay register, the overlay tie on the lock, the scenario-set editor (audit M3, M4, M5)
8993a14 RBM return (provisional): the directive s.17 classification and provisioning return filled from the system
ea48d0d The Mega Farm screen; the method cards inline on the Governance Centre setting (spec v4 s.16, 14.7)
a86e88b The audit trace per contract; the View-as-at picker on the contract's schedule page (spec v4 s.12.5, 6.11)

commit e9f1f98bd3371b936abc0066021dd875d3b47ee0
Author: DupleixInstitute <141166688+DupleixInstitute@users.noreply.github.com>
Date:   Fri Oct 9 12:07:34 2026 +0200

    Menu: the forward-looking model is the governed chain; legacy FLI tools move to Administration

    Forward-Looking Model is now Correlation Finder then Regression (FLI
    Adjustments); Scenarios & Overlays is Scenario Sets then Manual Overlays.
    Weighted Forecast, Credit Loss Data, Adjusted Forecast, Scenario Profiles,
    Economic Scenarios, External Calculations and Calculation History are not
    inputs of the governed chain and sit in one Administration entry, Legacy
    FLI tools, so they stay reachable. The navigation test pins both.

commit d823650b6b2061ac00718cd0af9d1817d02683c7
Author: DupleixInstitute <141166688+DupleixInstitute@users.noreply.github.com>
Date:   Fri Oct 9 12:18:37 2026 +0200
    Legacy FLI tools: a one-line notice on each screen that it is not used by the ECL, breadcrumbs under Administration
```

```
    The seven legacy screens (Weighted Forecast, Credit Loss Data, Adjusted
    Forecast, Scenario Profiles, Economic Scenarios, External Calculations and
    its history) now open with one line linking to Regression (FLI
    Adjustments) and Scenario Sets; the old retired box on External
    Calculations gives way to it. The history tab is labelled History so the
    seven tabs fit one row.

    Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>

CLAUDE (2026-10-13 09:03:27 UTC)

Still mapping the seven old FLI screens: the routes are listed, next I read each controller to see what tables they write.

Tool call: Bash

```
description: Outline the legacy FLI controllers and the tables they use
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && for c in MacroForecastWeightedController CreditLossDataController ManualForecastController
ScenariosController ExternalCalculationsController; do f=$(grep -rl "class $c\b" app/Http/Controllers | head -1); echo "=== $f
($(wc -l <$f) lines)"; grep -n -E "DB::table\('[a-z_]+'|[A-Z][A-Za-z]+::(query|where|create|find|updateOrCreate|insert)|
function [a-zA-Z]+\(|Inertia::render" $f | head -40; done; grep -rl "class ScenarioSetController" app/Http/Controllers
```

Result of Bash

```

 /**
  * The forward-looking route (spec v4 sections 14.6 to 14.8, 15.5): how an
  * approved fit, or an overlay, reaches every loan's PD for a period.
  *
  * Under the regression route the approved fit (proxy(t) = slope x
  * driver(t - lag) + intercept) is evaluated once per scenario of the
  * approved set, as at the end of the period and under the fitted lag (see
  * regressionAdjustments): the base window takes the actual driver lag
  * months before the period, the twelve-month window takes the driver lag
  * months before its end (an actual when that is on or before the period,
  * else the scenario's path), and the adjustment is the ratio of the
  * predicted proxies less one. The transmission method in force moves
  * each loan's pre-FLI PD under each scenario; the reported post-FLI PD is
  * the twelve-month PD whose stage PD is the probability-weighted stage PD
  * across scenarios, so the booked ECL is the weighted ECL (the weighting
  * method of 15.5), floored and capped, Stage 3 at 100 percent. Under the manual
  * overlay route the approved, unexpired overlays of the register are
  * applied the same way, each loan taking the sum of the adjustments whose
  * scope covers it (the book, its product group, its contract); under
  * regression plus overlay they sit on top of each scenario's adjustment.
  * With neither a fit nor an overlay, the PD holds and the loan says so.
  * Every loan records the route, the method, the fit, the set and the
  * overlays it was adjusted under.
  *
  * The register replaced the legacy fli_adj row for the system audit of
  * 9 October 2026, finding M3.
  */

CLAUDE (2026-10-13 09:06:16 UTC)

I have the picture of the governed chain. Now the schemas of the tables I plan to reuse, and how the as-at reader treats vintages.

Tool call: Bash

```
description: Show the schemas and contents of the scenario, projection and credit loss tables
--- command ---
M="/c/xampp/mysql/bin/mysql -uroot maiic_ifrs9_demo -N -e"
for t in ecl_projection_runs ecl_pd_term_structures macro_series fli_overlays scenario_profiles macro_credit_loss_definitions;
do echo "== $t"; $M "SHOW COLUMNS FROM $t" | awk '{printf "%s(%s) ", $1, $2}'; echo; done
$M "SELECT id,code,name FROM macro_credit_loss_definitions"; $M "SELECT * FROM scenario_profiles\G" | head -20; $M "SELECT id,
profile_id,name,probability,is_base_case,status FROM scenarios"; $M "SELECT * FROM scenario_sets"
$M "SELECT scenario_id, COUNT(*) FROM macro_statistics_data GROUP BY scenario_id"; $M "SELECT kind, COUNT(*) FROM
scenario_shocks GROUP BY kind"; $M "SELECT DISTINCT vintage FROM macro_series LIMIT 10"
```

Result of Bash

CLAUDE (2026-10-13 09:07:51 UTC)

I have enough of the governed chain. Checking column nullability on the tables I'll extend, and how Governance Centre settings are declared, before writing the migration.

Tool call: Bash

```
description: Check nullability and how governance settings are seeded
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && M="/c/xampp/mysql/bin/mysql -uroot maiic_ifrs9_demo -N -e"; for t in macro_forecast_weighted
macro_credit_loss_data; do echo "== $t"; $M "SHOW COLUMNS FROM $t" | awk '{printf "%s:%s:%s ", $1,$2,$3}'; echo; done; grep -rn
"scenario_weighting_method" --include=*.php app database config | head -8; ls database/migrations | tail -5; grep -n "fli_\|
scenario" database/seeders/GovernanceSettingsSeeder.php | head -30
```

Result of Bash

```

                'default' => 'Required',
34:     * recommendation; the seeder writes it as the first APPROVED row and the
127:            // (added 7 October 2026). Each is seeded with Dupleix's
170:                'description' => 'The 109 loans taken on at 31 July 2024 have no E-Banker history before that date; the
amortisation schedules and the fees in the take-on workbook are the only record. This decides whether the engine recomputes
each loan\'s EIR from origination on that record, or starts it at the take-on balance with no day-one history. The seeded
option uses the history wherever the block and the fees exist and is honest where they do not, and every loan carries the basis
it was built on (spec v4 section 6.9).',
242:                'description' => 'The Mega Farm programme is Government money that MAIIC runs on its behalf, at 15 percent
of which 5 is MAIIC\'s and 10 the fund\'s; 95 percent of the loans are in default and the losses are the fund\'s (spec v4
section 16, decision D30). The seeded option keeps the programme outside the EIR engine, computes MAIIC\'s 5 percent share on
the amount expected to be recovered, and provisions the loans fully in the ECL module against the fund. Open choice O22; Dr
Thom to confirm.',
248:                'description' => 'The programme has two seasons of history and seven thousand accounts: breadth without
depth. The seeded method takes the shape of the probability (term structure, macro sensitivity) from MAIIC\'s own agricultural
transition matrix and the level from the programme\'s observed cohort default rates through a measured, governed scalar (spec
v4 section 16.8). The cohort rate alone is the check; the programme\'s own matrix is declined until three seasons exist;
judgement with an overlay is for a season the data cannot describe. The method used for the 2025 provision is to be confirmed
by Finance.',
314:                'description' => 'IFRS 9 asks for the probability-weighted loss over a range of outcomes (5.5.17(a),
B5.5.42). The seeded method runs the forward-looking chain once per scenario and reports the weighted sum of the losses, which
captures that a downside hurts more than an upside helps. The other method, MAIIC\'s today, weights the macro path and
calculates one loss; it is kept so that past periods can be reproduced and the two reconciled when the switch is made (spec v4
section 15.5).',

CLAUDE (2026-10-13 09:08:20 UTC)

Writing the database migration for the model registry, run snapshots, per-scenario results and publication dates.

Tool call: Write

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\database\migrations\2026_10_13_100000_fli_module_registry_and_snapshots.php
--- content ---
<?php

use Illuminate\Database\Migrations\Migration;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Support\Facades\DB;
use Illuminate\Support\Facades\Schema;

/*
|--------------------------------------------------------------------------
| The forward-looking module (FLI module specification v1, 13 October 2026)
|--------------------------------------------------------------------------
| D-F2  fli_models and fli_model_versions: an approved fit is published as a
|       model version with an effective month; the route reads the version in
|       force at the reporting date, so a month-end applies the model and
|       does not have to re-fit it (D-F1).
| D-F3  ecl_scenario_results: the ECL of each loan under each scenario, so
|       the sensitivity, the impact screen and the booked allowance read the
|       same rows.
| D-F11 fli_run_snapshots: what one month-end ran under, in one row.
| D-F10 published_at on the macro and credit-loss observations: the date the
|       publisher released the figure, which the as-at reader honours.
| D-F9  risk_driver and double_count_review on the overlay register.
| The weighted forecast and the scenario profiles are tied to the governed
| scenario sets (governed_set_id, statistic_code, year_offset).
|
| The approved fits already in the database are published as model versions
| (one per period, effective from that period), so every month that ran
| before this migration keeps the model it ran under.

/**
 * The FLI model registry (FLI module specification v1, decisions D-F1 and
 * D-F2).
 *
 * The fits stay the calibration evidence. When a second person approves a
 * fit it is published here as a model version with an effective month; the
 * forward-looking route reads the version in force at the reporting date,
 * which is the latest published version whose effective month is on or
 * before it. A month-end therefore applies the approved model; it does not
 * have to re-fit it. The model is recalibrated once a year, or when an event
 * breaks the relationship, and the new version takes effect from its month
 * forward. Old versions are never edited: a version that a later one
 * replaces from the same month is marked SUPERSEDED, a version withdrawn is
 * RETIRED, and the months it governed keep pointing at it.

CLAUDE (2026-10-13 09:11:43 UTC)

Settings seeded. Before writing the close service I'm reading how the build-up panel derives the pre-FLI ECL, so the snapshot uses the same numbers.

/**
 * Closing the forward-looking month (FLI module specification v1, decisions
 * D-F3 and D-F11, section 7).
 *
 * record() measures the ECL of every loan under every scenario of the set the
 * route applied, weights it, and checks that the weighted figure equals the
 * allowance booked on the post-FLI PD. Each scenario's ECL is the loan's
 * booked ECL re-based from the booked stage PD to the scenario's stage PD
 * (lifetime for Stage 2, 1 for Stage 3), which is the ECL engine's own
 * measure (EAD x LGD x stage PD) at the scenario's PD. The loan-level rows go
 * to ecl_scenario_results; the totals, the inputs in force and the movement
 * against the previous month-end go to one fli_run_snapshots row.
 *
 * signOff() is the second person's approval of that record. A record whose
 * weighted ECL does not reconcile cannot be signed off, and a movement above
 * the governed tolerance needs a commentary first.
 *
 * Nothing here changes a loan, a PD or an ECL.

/**
 * The scenario projection (FLI module specification v1, decision D-F4).
 *
 * For the model version in force and the approved scenario set of a month it
 * projects, per portfolio and per scenario, the conditional PD of each future
 * year, the probability of surviving to it, the marginal PD (defaulting in
 * that year having survived the ones before) and the cumulative PD:
 *
 *   adjustment(s, y)  the model's predicted proxy for year y under scenario s
 *                     over the predicted base, less one; year 0 is the
 *                     adjustment the route books
 *   PD(s, y)          the transmission method in force applied to the
 *                     portfolio's exposure-weighted PD before FLI
 *   survival(y)       product over earlier years of (1 - PD)
 *   marginal(s, y)    survival(y) x PD(s, y)
 *
 * Inside the governed forecast horizon each year takes the scenario's path;
 * after it the adjustment falls in equal steps to nil over the reversion
 * years (IFRS 9 B5.5.50), and the years after that sit at the long-run PD
 * until the longest remaining term of the portfolio's performing loans.
 *
 * The projection is the evidence for Stage 2 lifetime losses year by year and
 * for the scenario workbooks; the booked Stage 2 ECL is still measured by the
 * ECL engine on the twelve-month PD the route writes, and the screen shows
 * the two lifetime PDs side by side.

```
 * a correlation, a fit, a base value or a scenario path for period P may only
 * read what was knowable by the end of P. Every FLI engine reads the series
 * through this class; none reads macro_series or credit_loss_series raw.
 *
 * When a row became knowable ("known from", a YYYYMM):
 *  - an actual or estimate: its observation period plus its publication lag
 *    (macro_series.lag_months, months after the period before the figure is
 *    published; 0 when the source states none);
 *  - an interpolated month (the bridge interpolates between two annual
 *    observations): the month the LATER of the two observations became
 *    knowable, because the interpolated value depends on it. With no later
 *    observation the row cannot be reproduced and is never knowable;
 *  - a forecast: the date carried in its vintage (a YYYY-MM-DD in the
 *    vintage text). A forecast with no dated vintage is never knowable for a
 *    past period (fail closed: an undated forecast cannot be shown to have
 *    been published by the reporting date).
 * A credit-loss proxy is derived from the period's own staged loan book, so
 * it is knowable at the end of its observation period.
 */

CLAUDE (2026-10-13 09:16:04 UTC)

The as-at reader ignores release dates on actuals. I'm extending it so an actual with a recorded release date becomes knowable from that date, which changes nothing today because no row has one yet.

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\app\Support\Fli\AsAtSeries.php
--- old_string ---
        $lag = isset($r->lag_months) ? max(0, (int) $r->lag_months) : 0;

        return $lag === 0 ? $period : SeriesAligner::shiftPeriod($period, -$lag);
--- new_string ---
        $lag = isset($r->lag_months) ? max(0, (int) $r->lag_months) : 0;
        $known = $lag === 0 ? $period : SeriesAligner::shiftPeriod($period, -$lag);
        // FLI module D-F10: an actual whose publisher's release date is recorded
        // ("published YYYY-MM-DD" in its vintage) is knowable from that date
        if (isset($r->vintage) && preg_match('/^published (\d{4})-(\d{2})-\d{2}/', (string) $r->vintage, $m) && $m[1] . $m[2] >
$known) {
            return $m[1] . $m[2];
        }

        return $known;
{
 "replace_all": false
}
```

CLAUDE (2026-10-13 09:16:35 UTC)

I'll add a known-from month to the credit-loss series so an external series released late is not read early, then bridge the external series in.

Tool call: Write

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\database\migrations\2026_10_13_110000_credit_loss_series_known_from.php
--- content ---
<?php

use Illuminate\Database\Migrations\Migration;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Support\Facades\Schema;

/*
|--------------------------------------------------------------------------
| When a credit-loss observation became knowable (FLI module D-F7, D-F10)
|--------------------------------------------------------------------------
| The proxies derived from MAIIC's own staged loan books are knowable at the
| end of their month (known_from stays empty). An external series entered on
| Credit Loss Data, such as the Reserve Bank's industry NPL ratio, is
| published weeks or months later: known_from carries its release month, and
| the as-at reader leaves the row out of any month before it.
*/
return new class extends Migration
{
    public function up(): void
    {
        if (Schema::hasTable('credit_loss_series') && ! Schema::hasColumn('credit_loss_series', 'known_from')) {
            Schema::table('credit_loss_series', function (Blueprint $t) {
                $t->char('known_from', 6)->nullable()->comment('YYYYMM the figure was published; empty = the end of its own
month');
                $t->string('source', 64)->nullable();
            });
        }
    }

    public function down(): void
    {
        if (Schema::hasColumn('credit_loss_series', 'known_from')) {
            Schema::table('credit_loss_series', fn (Blueprint $t) => $t->dropColumn(['known_from', 'source']));
        }
    }
};
```

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\app\Support\Fli\AsAtSeries.php
--- old_string ---
        $rows = DB::connection($connection ?? DB::getDefaultConnection())->table('credit_loss_series')
            ->where('observation_period', '<=', $p)
            ->orderBy('proxy_code')->orderBy('observation_period')
--- new_string ---
        $conn = $connection ?? DB::getDefaultConnection();
        $rows = DB::connection($conn)->table('credit_loss_series')
            ->where('observation_period', '<=', $p)
            // an external series is knowable from its release month (FLI module D-F7, D-F10)
            ->when(self::hasColumn($conn, 'credit_loss_series', 'known_from'), fn ($q) => $q->where(fn ($w) =>
$w->whereNull('known_from')->orWhere('known_from', '<=', $p)))
            ->orderBy('proxy_code')->orderBy('observation_period')
{
 "replace_all": false
}
```

Result of Write

```
File created successfully at: c:\xampp\htdocs\MAICC-IFRS9\database\migrations\

CLAUDE (2026-10-13 09:18:37 UTC)

I'm extending the registry so External Calculations can enter an externally calibrated model that goes through propose and approve, then reaches the loans through the same route.

Tool call: Write

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\database\migrations\2026_10_13_120000_fli_model_versions_external.php
--- content ---
<?php

use Illuminate\Database\Migrations\Migration;
use Illuminate\Database\Schema\Blueprint;
use Illuminate\Support\Facades\Schema;

/*
|--------------------------------------------------------------------------
| Externally calibrated model versions (FLI module, External Calculations)
|--------------------------------------------------------------------------
| A model calibrated outside the system (by a consultant, or in a validation
| workbook) is entered on External Calculations with its evidence. It is
| proposed by one person, approved by another, and then governs its months
| exactly as a version published from a fit does.
*/
return new class extends Migration
{
    public function up(): void
    {
        Schema::table('fli_model_versions', function (Blueprint $t) {
            if (! Schema::hasColumn('fli_model_versions', 'source')) {
                $t->string('source', 16)->default('fit')->comment('fit (the system\'s regression) or external');
            }
            if (! Schema::hasColumn('fli_model_versions', 'evidence')) {
                $t->text('evidence')->nullable();
            }
            if (! Schema::hasColumn('fli_model_versions', 'proposed_at')) {
                $t->timestamp('proposed_at')->nullable();
            }
        });
    }

    public function down(): void
    {
        Schema::table('fli_model_versions', function (Blueprint $t) {
            foreach (['source', 'evidence', 'proposed_at'] as $c) {
                if (Schema::hasColumn('fli_model_versions', $c)) {
                    $t->dropColumn($c);
                }
            }
        });
    }
};
```

CLAUDE (2026-10-13 09:19:34 UTC)

I'll add a what-if service so the Impact screen can compare a proposed scenario set against the booked figures before anyone approves it.

Tool call: Edit

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\app\Services\Fli\FliRouteService.php
--- old_string ---
    /**
     * The adjustment of each scenario in each forecast year (FLI module D-F4):
--- new_string ---
    /**
     * The adjustment of each scenario of a set for a period, as the route
     * would book it (year 0), without writing anything. The Impact screen
     * uses it for a set that is proposed but not yet approved.
     *
     * @return array{0:array<string,mixed>,1:array<string,array<string,mixed>>}
     */
    public function scenarioAdjustments(string $period, object $fit, int $setId): array
    {
        return $this->regressionAdjustments($period, $fit, $this->sets->paths($setId));
    }

    /**
     * The adjustment of each scenario in each forecast year (FLI module D-F4):
{
 "replace_all": false
}
```

Tool call: Write

```
file_path: c:\xampp\htdocs\MAICC-IFRS9\app\Services\Fli\FliImpactService.php
--- content ---
<?php

/**
 * External Calculations and History (FLI module specification v1).
 *
 * External Calculations is where a forward-looking model calibrated outside
 * the system (by a consultant, or in a validation workbook) is entered: the
 * driver, the credit-loss measure, the lag, the slope and the intercept, the
 * month it was calibrated on and the month it governs from, with the
 * evidence. One person proposes it and a second approves it; it is then a
 * model version like one published from a fit, and the forward-looking route
 * applies it to every loan. The page also shows what the route would do for
 * the month under the version in force, before anyone applies it.
 *
 * History is the record of every month: what it ran under (model version,
 * scenario set, overlays, vintage), the ECL before and after FLI, the
 * weighted ECL against the booked one, the sign-off, and the approvals that
 * led to it.
 *
 * The older one-slope screens wrote fli_adj straight onto the loans outside
 * maker-checker (system audit of 9 October 2026, finding M6); that path is
 * replaced by this one, which reaches the loans only through the governed
 * route.
 */

/**
 * Adjusted Forecast (FLI module specification v1, decision D-F4): the
 * forecast of the credit-loss measure and of the PD that the model version
 * in force gives under each scenario, year by year.
 *
 * The screen used to take a typed intercept, slope and macro path and keep
 * the result in the session. It now reads the approved model and the
 * approved scenario set of the month, so the forecast it shows is the one
 * the ECL is built on: year 0 is the adjustment the route books, the later
 * years run to the governed forecast horizon and revert to the long-run PD
 * after it, and each portfolio's PD term structure (conditional, survival,
 * marginal, cumulative) is stored for the month.

CLAUDE (2026-10-13 09:25:07 UTC)

Routes are registered. Now the menu: the screens come back out of Administration into their own Forward-Looking Information entry, with no legacy label.

Tool call: Bash

```
description: Read the top of the menu and how sidebar icons resolve
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && sed -n 55,100p config/menu.php; grep -n "'icon'\|icons\b" resources/js/Layouts/AppLayout.vue |
 head; grep -rn "chart-line\|'globe'\|globe" resources/js/Jetstream/*.js resources/js/Layouts/*.vue 2>/dev/null | head -5
```

Result of Bash

```
        ['color' => '#FBBF24'] + $leaf('Dashboard', 'dashboard', 'home'),

        ['color' => '#86EFAC'] + $leaf('Workspace', 'workspace.index', 'tasks'),

        // The hub lists every report, reconciliation and export; the screens
        // it opens light this entry up.
        ['color' => '#F6B131', 'match' => [
            'ifrs9-reports.*', 'reports.*', 'stress-testing.*', 'rbm-return.*', 'auditor-pack.*',
        ]] + $leaf('Reports', 'ifrs9-reports.index', 'chart-bar'),

        ['color' => '#38BDF8'] + $section('Portfolio Setup', [
            $tab('Loan Portfolios', 'portfolios.index'),

# MAIIC UI overhaul - shared brief (9 Oct 2026)

Read this whole file before you start. Several agents work in the SAME working tree at the same time, each on its own files.

## The system
- Laravel + Inertia + Vue 3 + Tailwind app: `C:\xampp\htdocs\MAICC-IFRS9`, branch `eir_revenue_recognition`. IFRS 9 ECL and EIR
platform for MAIIC (Malawi Agricultural and Industrial Investment Corporation). It was cloned from an older generic loans/
medical platform, so it carries legacy screens.
- Database: `maiic_ifrs9_demo` (MariaDB, `C:/xampp/mysql/bin/mysql.exe -uroot`, no password). The app's `.env` points at it.
NEVER write to `maiic_ifrs9` or any other database. Do not change data unless your task says so.
- Brand: Tailwind palettes `maiic` (green, 50-900) and `maiicgold` (400-600). Shared classes in `resources/css/app.css`:
`maiic-panel`, `maiic-table` (+ `maiic-table-wrap`, `num`, `tr.total`), `maiic-badge` (+ `-green`, `-gold`, `-red`, `-grey`,
`-solid-green`), `maiic-kpi` (+ `-label`, `-value`), `maiic-filterbar`, `maiic-flabel`, `maiic-input`, `maiic-select`,
`maiic-action` (+ `-view` eye, `-edit` pencil, `-delete` bin, `-neutral`), `maiic-section-title`, `maiic-empty`. Light mode
only.
- Layout `resources/js/Layouts/AppLayout.vue`: page header comes from the `#header` slot (title left) and the `#actions` slot
(buttons, rendered TOP RIGHT), or the `title`/`description` props. Pages are full width now (no `max-w-7xl mx-auto` page
wrappers; do not add them back).
- Navigation `config/menu.php`: related screens are grouped as SECTIONS with TABS. The layout draws the tab bar automatically
above the page header for any route listed in a section's `tabs`. So a page must NOT draw its own copy of those tabs. Read
config/menu.php to see which section/tabs your screens belong to.
- Pagination: every server list is 15 rows a page; `resources/js/Components/Pagination.vue` is the one pager (numbered pages).
Use it on every paged list.
- Fontawesome icons must be registered in `resources/js/app.js` (library.add). If you need a new icon, report it to the
coordinator instead of editing app.js (shared file) - or use an inline SVG.

## The reference design: TNM Mpamba
`C:\xampp\htdocs\TNMMpamba` (branch feature/ifrs9-ui-overhaul) is the same platform, already overhauled. READ ONLY - never edit
it. Look at its pages for the patterns to copy (its classes are `tnm-*`; in MAIIC use the `maiic-*` equivalents and MAIIC
colours):
- page header with title + one-line description left, action buttons right;
- tabs on a page that holds more than one job (e.g. its Settings, PD/LGD pages, methodology comparison) instead of one long
scrolling page;
- import screens: a short "how to" instructions panel, a "Download sample CSV" button, the upload button, clearly labelled tabs
(e.g. Upload / History);
- tables with header band, zebra rows, right-aligned numbers, icon actions (view / edit / delete) using `maiic-action-*`;
- errors and messages in nicely formatted boxes (icon, title, text), not raw text or browser alerts;
- empty states that say what to do next;
- reports and exports (PDF/Excel) branded and formatted.
Find TNM's equivalents with grep/glob under `C:\xampp\htdocs\TNMMpamba\resources\js\Pages` and `resources\views`.

## Standards every screen must meet
1. Header: title + one-line plain-English description left; actions top right.
2. No long scrolling page: if a page holds more than one job, split it into in-page tabs (simple Vue tab state, styled like the
layout's tab bar: `border-b` row, active tab `border-b-2 border-maiic-600 text-maiic-800`). Long tables paginate at 15 (server
side if the data is server paged; else a small client-side pager showing 15 rows with numbered pages).
3. Tables: `maiic-table` inside `maiic-panel`, numbers right-aligned with `num`, icon action buttons with titles (tooltips),
consistent badges.
4. Forms: labelled fields (`maiic-flabel` + `maiic-input`/`maiic-select`), validation errors shown under the field, primary
button MAIIC green.
5. Imports: instructions, "Download sample CSV" (a real CSV with the exact headers the importer accepts - build the sample from
the importer's code, never guess), upload, history; clearly labelled.
6. Plain English, short, no em dashes (use commas or plain hyphens), no jargon the finance team would not use. Spec references
like "(spec v4 section 12.5)" do not belong on screen; remove them from visible text.
7. Correctness: never hardcode figures or fake data to make a screen look full; an empty state is fine.

## Tools (use these, they are serialised/safe)
- App for screenshots: http://127.0.0.1:8070 (NOT 8050, that one is the user's).
- Log in (creates a session): `bash TOOLS/login.sh TOOLS/c_<yourname>.json`
- Screenshot: `node TOOLS/shot.cjs TOOLS/c_<yourname>.json <out.png> <path e.g. eir-coverage> [width]` (prints status + JS
errors). Look at the PNG with the Read tool.
- Log out when finished: `bash TOOLS/logout.sh TOOLS/c_<yourname>.json`
- Build assets: ONLY `bash TOOLS/build.sh` (it waits for a lock). Never run `npm run build` or `npm run dev` directly.
- TOOLS = `C:/Users/DELL/AppData/Local/Temp/claude/c--xampp-htdocs-Stress-Testing-App/c9a0f915-2064-4f18-9b98-77857ef71421/
scratchpad/tools`. Save your screenshots under TOOLS/shots/<yourname>/.
