

Claude session transcript: MAIIC raw query scripts

This is the complete record of the part of a Claude Code session (5 and 6 October 2026) that dealt with the three raw query scripts MAIIC sent for Extracts A, B and C. It is saved so that another member of staff, with or without an AI tool, can follow what was done, in what order, and why.

It starts at the request to analyse the scripts and runs to the audit of the eighteen follow-up extracts MAIIC returned on 7 October 2026 and the notes written from it. Earlier, unrelated parts of the same session are left out.

The work falls into six stages, in time order:

1. Analysis of the three scripts and tests against the delivered extract files (5 October).
2. The data dictionary query pack and its run order.
3. The plain-language PDF report, version 1, and the session transcript and build files saved for review.
4. The independent review by Codex, the response to it, and version 2 of the report and query pack, including suggested changes to MAIIC's scripts and to the Duplex engine code.
5. The data dictionary results returned by MAIIC on 6 October, what they showed, and the follow-up extract queries written from them.
6. The audit of the eighteen follow-up extracts received on 7 October: date formats, reconciliations to the balance history, loan book, Extract C and trial balance, the interest rebuild, the repayment-profile tests, and the notes to Barry and Credit that followed.

What is included: every user message, every reply shown to the user, every tool call with its full input (commands, scripts and file contents), and every tool result in full. Where a long result was stored by the tooling in a side file, that file is reproduced here.

What is left out: the assistant's internal reasoning, automatic system reminders (they carry unrelated workspace context), the text of the PDF skill, and image outputs (page renders used for visual checks).

How to follow it: the files produced along the way are in the same folder as this transcript. The Build files subfolder holds the Python scripts, with a README. The data dictionary results themselves are in the Query Request Responses 6 Oct 2026 folder next to this one.

Corrections made during the session, left in place where they were made: (a) the first analysis said Extract A shows one disbursement tranche per loan, which a later test showed was wrong; (b) version 1 of the report overstated several points that the Codex review identified, and version 2 corrects them. Both are explained in the report's Appendix E.

Times are UTC. Source: the session log ee984144-7b28-4df1-9a6e-560f112869e9.jsonl, entries 4344 to 5920. Events: 638.

USER (2026-10-08 16:25:54 UTC)

please build the code and do everything as per the spec comprehensive

CLAUDE (2026-10-08 16:26:30 UTC)

Understood. This is the full P4b-onward build, and it is days of work, so I'll do it in the spec's own order, with tests and a commit after each green step, and keep going until the context runs out — the commits and the after-build report carry the state to the next session. Order: the governance catalogue (section 4.2) → the landing zone, pack gates and route-1 loader (6.3–6.5) → the three build methods and `eir:build-loan-books` (6.2, 6.6) → `eir:bootstrap --verify` (6.10) → the feed screen (6.8) → then P5.

Starting with the catalogue: 20 settings to add, every option within the 60-character column.

Tool call: Bash

description: Locate the catalogue entries to replace and extend, and the test count

--- command ---

```

CLAUDE (2026-10-08 16:28:25 UTC)

Now the landing zone (spec 6.3–6.5): the migration, the pack reader with its gates, the route-1 loader command, and tests. Writing the migration first.

Tool call: Write

file_path: C:\xampp\htdocs\MAICC-IFRS9\database\migrations\2026_10_08_000000_create_ebanker_landing_zone.php

--- content ---

<?php

use Illuminate\Database\Migrations\Migration;

use Illuminate\Database\Schema\Blueprint;

use Illuminate\Support\Facades\Schema;

```
/*
|-----
| The E-Banker landing zone (spec v4 section 6.3, decision D22)
|-----
| Raw rows from E-Banker, loaded exactly as received and never edited.
|
| ebanker_loads      one row per pack: period, route, who, when, the manifest,
|                    the gate results, the watermark after loading
| ebanker_pack_files one row per file in a pack: query id, version, rows,
|                    SHA-256, and whether the file passed its gates
| ebanker_raw_rows   every row of every file, verbatim as JSON, keyed by the
|                    query id and the source table's own key. A row that
|                    arrives again with different content becomes a new
|                    version (the earlier one keeps superseded_at), so a
|                    month can be re-derived exactly as it looked at the time.
|
| The spec names one table per E-Banker source (ebanker_ledger, ebanker_
| balance_history, ...). They are kept here as logical tables inside one
| physical table, distinguished by query_id, so that the loader and the gates
| are one piece of code for every query and a new query needs no migration.
| Nothing downstream reads the raw rows except the build (section 6.6).
*/

/**
 * The one door of the landing zone (spec v4 sections 6.3 and 6.4).
 *
 * A pack is a folder of extract files plus manifest.json. Whatever route
 * delivered it, this service: reads the manifest; runs the gates (every file
 * named exists, its SHA-256 matches, its row count matches, its query id is one
 * the register knows, every date in it parses in the format the manifest
 * states, and the manifest's accepted exceptions are recorded against the
 * load); then lands every row of every file verbatim as JSON in
 * ebanker_raw_rows, keyed by the query id and the source table's own key, as a
 * new version where the content differs from the version already held and
 * never as an overwrite; and records the load with its gate results and the
 * watermark (highest source key) per query.
 *
 * A gate failure quarantines the pack: the load row is written with the
 * failures named, no raw row is written, nothing downstream moves.
 */

CLAUDE (2026-10-08 16:30:39 UTC)

Now the test for the landing zone — a small fixture pack with a good file, a tampered hash, a bad date, and a re-land that versions a changed row.

USER (2026-10-08 16:35:02 UTC)

This session is being continued from a previous conversation that ran out of context. The summary below covers the earlier portion of the conversation.

Summary:

1. Primary Request and Intent:

The session continues the MAIIC IFRS 9 EIR engagement (Dupleix Institute; sponsor Dr Thomson Kumwenda, CFO; ICT Barry Makumba; Finance Tamanda Sitimawina). Over this session the user asked, in order: finish the GL/ZF re-audit and report; evaluate Barry's re-sent P2_06/P1_05 files; set out what is outstanding to build what Dr Thom wants; whether loan books can be loaded from the queries (bootstrap/legacy importer) and which O-decisions are Dr Thom's; decide O19 ("lets use the system"); put every open O item in the Governance Centre with seeded defaults, including O10; make the PLR rule the evidence-based default; write spec v4 in the usual three formats (.md/.docx/.pdf) in plain language, delete (archive) previous versions, commit and push everything; adopt the ZNBS/FDH suite UI layout (with light and dark mode) and include it in the spec; add audit workbooks (as done for ZNBS); write sections 14 and 15 (FLI and scenarios) "with proper explanations and background"; ensure the repo holds the reference logic from the source repos; include the engines in the bootstrap; name FDH's guardrail/structural-events/proxy-deriver/profiler as adoptions; treat the transmission-method alternatives as governed options and have "the system explain each method well and its preconditions"; save build files and session transcripts into the MAIIC repo; analyse Mega Farm/seed loans and the 2025 AFS treatment, write the O22 recommendation, add section 16 (plain language), add 16.8 PDs with little history (user is "following up on how the mega farm loans were treated"), add the sector-PD-scaled option; check for a December 2025 ECL computation; draft the email to Dr Thom (cc Tamanda) with three ECL questions, Mega Farm loan books, the S&P method alongside transition matrices, and "on track to have built the system by Wednesday", data requests ending tomorrow; analyse Barry's pack 2 results (handed over from another session) and update the spec; build a meaningful demo on a test DB while keeping the current copy; update the manual after the build and create an after-build spec comparing with the original; check arrears-days data; confirm 181 days is MAIIC's rule (user: "181 days is correct. Where did you get that MAIIC's rule is 90 days?"); search the net for the RBM DFI directive; save it beside the spec and "proceed setting the governed amounts to cleverly consider the directive"; compare the staging rules with the accounting policy and the November ECL calculation, then "ok proceed"; and finally **"please build the code and do everything as per the spec comprehensive"**.

Standing constraints: the MAIIC spec must name no other client (user: "Remember we are doing a spec for MAIIC"); the production DB `maiiic_ifrs9` is never opened for demo work (demo on `maiiic_ifrs9_demo` via `.env.demo`, git-ignored); client data is committed under `docs/bootstrap` in a private repo with a stated classification; client drafts are from Edward Mazibuko; commit with the Co-Authored-By line.

2. Key Technical Concepts:

- Laravel/Inertia/Vue 3 app MAIIC-IFRS9 (branch `eir_revenue_recognition`, fast-forwarded to master repeatedly); artisan commands (`eir:import-trial-balances`, `eir:import-reference-rates --user=`, `eir:derive-spreads`, `eir:generate-schedules --dry-run`, `eir:run-revenue {period} --user= --contract=*`, `ifrs9:recalculate-ecl`), services (`ContractMasterImportService`, `MappedFileReader` with header aliases, `ScheduleWorkflowService::approve`, `EirCalculationService::calculate/lock/lockMany`, `EirGlReconciliationService::forPeriod/overallSummary`, `GlInterestImportService`, `StagingClassifier` reading tape header keys `1_30_days...271_360_days`, `StagingThreshold::forFacility`).
- Governance Centre catalogue (`GovernanceService::catalogue()`), options ≤ 60 chars (value column), seeder idempotent; now 48 settings.
- Spec v4 landing zone design: `ebanker_loads`, `ebanker_pack_files`, `ebanker_raw_rows` (verbatim JSON payload, versioned by `query_id+source_key`), `ebanker_queries` register; `pack` = CSVs + `manifest.json` (`query_id`, `rows`, `sha256`, `accepted_exceptions`, date format from source string "m/d/yyyy"); gates; five feed routes governed; three build methods (A bootstrap of stored runs, B derived from ledger, C printed report importer); `eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify`; golden numbers.
- E-Banker facts: 28 Diff-Int year-end postings (22 debits type 303, 6 credits type 120) with contra one net voucher per batch to 4215 (+32,956,675.55) and 4216 (-21,733,262.70); December income ties to the cent; `INTEREST_PRODUCT`

holds history but PRINCIPAL_PRODUCT equals interest; stored loan book carries arrears buckets, OVERDUE_PRINCI_DATE (days from it = DPD) and OVERDUE_PERIOD (months); contract ids stored without leading zeros; P2_13 REQUEST_STRING exported as literal <CLOB>.

- RBM Financial Services (Credit Risk Management for DFIs) Directive 2018 (Gazette 13 Jul 2018 No. 18A pp.42–47): short-term ≤12m, medium 12–60m, long >60m; non-performing (substandard) from 91 days short-term / 181 days medium-long; non-accrual s.13; provisions 0/5/20/50/100%.
- Accounting policy (2025 FS notes 3.8, 22.8.1): default at 4 missed payments or 90 DPD with "more lagging criterion" door; November 2025 ECL model: Stage 2 at 31–180, Stage 3 >181; 100 loans vs 125 in E-Banker.
- Mega Farm programme: Government K20bn fund, 15% split 5 MAIIC / 10 fund, losses to fund, K51.5bn gross, K48.7bn Stage 3, K39.76bn ECL; decision D30 (out of EIR engine, in ECL module, 5% share on net amount).
- Python tooling in scratchpad venv songenv (pandas, openpyxl, reportlab, pypdfium2, python-docx); spec_render.py (md → docx + pdf); note builders sharing g103_head2.py helpers.

3. Files and Code Sections:

- OneDrive specs: 3. Project Execution\specs\MAIIC_EIR_Engine_Specification_v4_2026-10-07.md/.docx/.pdf (55 pages; sections 0–17: data, arithmetic incl. 3.4 corrected and 3.6 directive+staging comparison, decisions D20–D31, 48 settings table, section 5 owed items, 6 ingestion (6.1–6.11 incl. landing zone, five routes chosen anytime, three build methods incl. C, take-on 6.9, bootstrap 6.10 with engine chain 6.10.1 and golden numbers 6.10.2, as-at 6.11), 7 importers, 8 build plan, 9 baselines, 10 risks, 11 suite UI + light/dark, 12 audit workbooks, 13 macro, 14 FLI (14.1–14.10 incl. guardrail/register/deriver/profiler and 14.7 transmission methods with method cards), 15 scenarios, 16 Mega Farm (16.1–16.8), 17 glossary). Previous versions archived to 9. Archive\Specifications superseded by v4 (2026-10-07) (v3 PDF still in specs, open in viewer). Also 022 recommendation...8 Oct 2026.pdf, 013 staging rebuttal...8 Oct 2026.pdf, After_Build_Report_Demo_2026-10-08.md, the directive PDF extract.
- Repo docs: docs/MAIIC_EIR_Engine_Specification_v4_2026-10-07.md (v3 removed), docs/After_Build_Report_Demo_2026-10-08.md, docs/manuals/installation/09-data-loading.md (new 9.8 interim E-Banker loading sequence), docs/bootstrap/ (manifest.json 82 files: ebanker-pack-2026-10-07 (23 CSVs), ebanker-pack-2026-10-08 (7 CSVs), data-dictionary-2026-10-06 (24), trial-balances/{monthly (20 xls), afs-bridge-2025-12/{2026-08-19,2026-09-10}, afs-mapping-2023-to-2026-08}, takeon workbook, queries (3 sql), README), docs/reference/ (63 files from ZNBS suite / FDH Laravel / plain-PHP with manifest+README by section), docs/regulatory/RBM...Directive_2018...pp42-47.pdf, docs/templates/Take-on schedules - Upload summary template.xlsx, docs/build-files/ (all scripts), docs/sessions/ (two transcripts md+pdf).
- Code committed: app/Services/Eir/GovernanceService.php catalogue — 48 entries (added contractual_record, partly_drawn_interest_basis, expected_cashflow_basis, history_before_dec_2025, trueup_gl_account, auditor_export_format, keyman_insurance_treatment, nascomex_preference_shares, staging_rebuttal (description cites the directive; apostrophe escaped as Malawi\'s), rate_change_classification, schedule_approval_control, historic_materiality_assessment, fee_reclass_journal, mega_farms_scope (seeded 'Out of EIR engine; in ECL module; 5 percent share on net'), ebanker_feed_route (replaces loan_book_feed; options Route 1–5), loan_book_build_method (A/B/C, default B), takeon_history_basis, megafarm_pd_method (seeded 'Agricultural-sector PD scaled to the programme'), megafarm_scalar_ceiling, macro_source_precedence, fli_adjustment_route, fli_transmission_method, fli_asset_correlation, fli_expected_sign_test, fli_r2_cutoff, fli_min_observations, fli_alpha, fli_normality_limits, scenario_weighting_method, scenario_minimum_count, scenario_weight_bounds, scenario_calibration_note, overlay_requires_approved_set, dpd_basis, stage3_missed_instalments; plr_mid_period default 'Whole month at the month-end rate (E-Banker)'); tests/Feature/Eir/GovernanceServiceTest.php asserts 48.
- database/seeder/StagingThresholdSeeder.php (rewritten): DEFAULT min_tenor 0 → 31/91; DEFAULT min_tenor 13 → 31/181; MEGA_FARM → 31/91; LONG_TERM min_tenor 13 → 91/181 future-dated 2099; const DIRECTIVE; tests/Feature/Eir/StagingThresholdSeederTest.php (5 tests).
- .gitignore adds .env.demo; .env.demo (DB_DATABASE=maiic_ifrs9_demo, APP_ENV=demo).
- Uncommitted new code (P4b landing zone):
 - database/migrations/2026_10_08_000000_create_ebanker_landing_zone.php — tables ebanker_loads (pack_hash unique, pack_name, route, period, run_at, date_format, manifest JSON, gates JSON, status PENDING|LANDED|QUARANTINED, watermarks JSON, loaded_by FK users, loaded_at), ebanker_pack_files, ebanker_raw_rows (load_id, query_id, source_key, account, row_date, payload JSON, row_hash, version, superseded_at; unique query_id+source_key+version), ebanker_queries (query_id, title, source_table, key_column, account_column, date_column, version, sql, sha256, incremental).

- database/seeder/EbankerQuerySeeder.php — queries() static list of 64 entries (P1_01...P3_18, GL_01–03, ZF_01–03, M09_01–03, MF_01–08, TB, DD_01...DD_16i) with key/account/date columns; updateOrInsert on query_id.
- app/Services/Ebanker/PackLandingService.php — land(string \$packDir, ?int \$userId, string \$route='ROUTE_1_MANUAL', bool \$dryRun=false): array{load_id,status,gates,files,watermarks}; reads manifest.json; gates (file exists, sha256, rows count, query in register, date parse in manifest format, key column present); versions rows (supersedes changed rows); records watermarks (max numeric key); readCsv (BOM/Windows-1252, drops SQL Developer's unnamed first column, 5-error cap); parseDate with padded/unpadded formats and '!' prefix, try/catch; route constants.
- app/Console/Commands/LandEbankerPack.php — eir:land-pack {folder} [--route=] [--user=] [--dry-run]; prints a table (bug at line 46: uses \$res['new'] where \$r['files']) for a QUARANTINED pack is the gates array).
- tests/Feature/Ebanker/PackLandingServiceTest.php — 7 tests (good pack, tampered hash, bad date, unknown query, versioning, idempotent re-land, dry run); all passing; sqlite in-memory, seeds user id 1.
- Scratchpad demo scripts (also in build-files): demo_load_loan_books.py (method A: P2_08 latest run → loan_books upsert, contract_id lstrip('0'), NaN guard), demo_contract_master.py (184-row CSV with importer header aliases, REPAYMENT_FREQUENCY MONTHLY, SCHEME_CODE), demo_schemes.py (DD_10 → schemes), demo_stage.py (DPD from OVERDUE_PRINCI_DATE, buckets under tape header names, overdue_days update), make_email_drthom.py (.eml draft), o22_note.py, o13_note.py, gl03_note.py, pack2_note.py, patch_spec_*.py.

4. Errors and fixes:

- Bash heredocs with quotes failed → wrote Python via Write tool.
- My earlier claim that the 22 Diff-Int debits never reached income was a double count (debits are type 303 inside "ordinary interest"); corrected in spec 3.4, audit report, and withdrawn explicitly.
- Claimed stored loan book had no arrears → wrong: buckets/OVERDUE_PRINCI_DATE exist; staging all Stage 1 was due to wrong dict keys and months-as-days; fixed in demo_stage.py.
- Said MAIIC's rule was 90 days → user corrected (181 is MAIIC's); 90 was IFRS 9 B5.5.37; found the RBM directive confirming 181/91.
- Unescaped apostrophe in catalogue description broke PHP (commit ce7626e broken briefly); fixed with Edit after re-read (sed/python replacements failed) → 53a85c6.
- PackLandingService: FK violation (no user) → seed user in test; Carbon createFromFormat throws → try/catch; unpadded dates (1/31/2026) failed strict round-trip → added n/j/Y candidates with ! prefix.
- Landing the real bootstrap: manifest is at docs/bootstrap/ root (not the sub-folder); DD query ids not in register → added 24 DD entries to seeder; then pack QUARANTINED and command crashed on Undefined array key "new" (display bug) — quarantine cause not yet seen.
- Stress-Testing-App push rejected (remote ahead) → rebase, resolved conflicts in quarterly spec (kept both sections, mine as E0.4), rebuilt PDF, pushed.
- Legacy medical tests (92) fail on master pre-existing (404 routes); EIR suite green (243 passed).

5. Problem Solving:

Demo DB maiic_ifrs9_demo built: 161 tables, 48 governance settings, 21 E-Banker month-ends (2,361 rows), 3,803 TB lines, 18 schemes, 144 contracts (40 held), PLR 48 rows, 31 schedules approved under bootstrap label, 31 EIRs solved and locked (admin override), revenue Dec 2025 (28) and Aug 2026 (31) with cash from schedules, Extract C loaded as GL interest (1,564 rows, 5,293,988,207.06), reconciliation Dec 2025 (28 agree/47 explained/41 unexplained), staging by tenor class (1,300/608/453; Dec 2025 78/20/25). Staging thresholds seeded per directive. Spec v4 complete through section 17 with decisions D20–D31. Current: landing the bootstrap folder into the new landing zone on the demo.

6. All user messages:

- "So what is outstanding for us to build the system now and deliver what Doc Thom wants?"
- "Also tell me if all the loanbooks can be updated from the queries received at the back end or with a bootstrap or legacy file importer. If possible, tell me the procedures. Which are the O decisions for Dr Thom"
- "Which record is contractual: signed offer letter or system => lets use the system"
- "Can we include on governance centre all the possible Open O items so that Dr Thom can change as when he is ready to confirm with seeded defaults"
- "O10 Which GL absorbs the EIR true-up => let this be set on the governance centre"
- "what are the options for PLR?" / "So lets add it to the governance with the seeded default recommended"
- "have you started developing the spec in our usual three formats in plain language"

- "delete previous versions" / "commit and push everything that needs to be pushed" / "we also want to change the ui to match the stress testing layout with report hub, modelling etc as done on the FDH Laravel repo. see if you can connect to the fdh laravel repo for ideas"
- "adopt this Ui layout and include it in the specs" / "Are you building now. Wait and do the spec first with detailed spec details"
- "Ensure the repo has the reference logic from the references repos so that the completeness of the spec can be verified"
- "what engines are available in the app?" / "Can these engines be run in the complete bootstrap as was done in the znbs repo" / "anything to push to the spec" / "...ok add it" (guardrails etc.)
- "can you merge the branches into main"
- "What is the transmission mechanism for the fLI to the Pds?" / "Have we accommodated the alternatives in the build?" / "Yeah the system must explain each method well and its preconditions"
- "save the build files and session files into the maiic repo so that others can pick it up" / "where is the chat or transcript on one drive"
- "what do you think is was the account where the year end adjustments were effected last year in December 2025" / "please check" / "yes add this query and also in pdf format" / "open the pdf" / "Is there any other query to run?" / "how about some seed loans. What do you see?" / "yes write the pack" / "where have you saved the queries for this seed loans" / "open the pdf" / "open the file that has the queries" / "which files have the queries we want today so far" / "give me the two paths for these" / "so do have an extract results for all loan books to date?" / "I mean do we have an sql extract of all periodic loan books?" / "So the query now fetch the seed loans?" / "How are the seed loans reported on the December 2025 afs?" / "proceed with your recommendation and also add a section on the spec explaining like a teacher a full treatment of the seed and mega farm loans" / "Ensure this is in plain language" / "open the spec pdf"
- "We have are applying a transition matrix methodology for the PDs. The mega farm and seed loans don't have much history so what can we do logically?" / "ok add section 16.8 but I am following up on how the mega farm loans were treated"
- "check if we have an ECL computation for December 2025 and if this has mega farm loans"
- "Draft an email to Dr Thom copying Tamanda requesting these three ECL questions including request of the monthly Mega Farm loan books so that the model accommodates them. Explain our understanding of the Mega Farm loan book arrangement and explain that our system design will also accommodate the S&P methodology used alongside the transition matrix approach. Explain that we are on track to have built the system by Wednesday so the data requests should end by tomorrow since Barry has managed to provide the amended queries which gave us all the answers" / "open the email"
- "How about a second method of applying the agricultural sectoral PDs for the MAIIC portfolio on the Mega Farm loans? What do you think?" / "add it as the third option"
- (cross-session handover) "can you analyse what you received so far" / "update the spec accordingly with what you have learnt"
- "I have a meeting with Dr Thom tomorrow. Do you think we can have something meaningful to build on a test database whilst maintaining the current copy?" / "=> why can't this be done?" / "continue building and run your tests, We may win" / "update the manual after the build and create an after-build spec comparing with the original spec used" / "Have you finished building according to the spec?"
- "how about arrears days data. Can we get it from the queries?" / "=> 181 days is correct. Where did you get that MAIIC's rule is 90days?" / "don't worry, there is a directive from RBM about DFI's. Can you search for this on the net" / "save the directive where the spec is and proceed setting the governed amounts to cleverly consider the directive"
- "compare the ageing rules with the accounting policy and the november ecl calculation" / "ok proceed"
- "please build the code and do everything as per the spec comprehensive"
- Also earlier in this session: "Remember we are doing a spec for MAIIC"; "and background"; "Let's not replace the bootstrap importer. Let's have it as an option"; "Do these options allow also using the loanbook importer route?"; "Okay push this method C"; "At any time we can choose the pipeline route preferred"; "Can we have all the options"; "The system must have the ability to view the EIR computation for any specific date"; "So where must this workbook be saved in the repo"; "I mean, we want to load these takeon schedules automatically maybe with a bootstrap. In ZNBS the files were in the docs folder/. Can we adopt the same method for the takeon schedules"; "So which files are covered in the bootstrap"; "The trial balances and the audited accounts => how are the trial balances used in the app"; "So if the TBs are used as the check, can't we save them in the same landing area as the others"; "check for the recent emails from Dr Thom with the mapped december 2025 TBs which agree to the Afs" / "if you find them then save"

them" / "they were sent in outlook"; "I like how we captured the macro statistics on the ZNPS repo with APIs to the world bank... make your suggestions for adoption" / "Mention the current build and the suggestions in the new spec. Go ahead and adopt"; "push the spec"; "Lets review how the forward looking adjustments are done... correlation finder... What do you suggest" / "I like that. How about the scenarios..." / "can you add the suggested section 14 and 15 with proper explanations"; "whats hte decision table?"; "Now let me ask about the specification => is there a better way of ingesting the loan books to date?" / "How can we allow integration with this landing zone pipeline..."; "Can you update the amortisation schedules excel file with blanks for arrangement and legal fees for Tamnda to fill in and then build in the options suggested with a seeded option that is reasonable. Confirm that we would be able to compute the EIR at December 2024, December 2025 and December 2026".

7. Pending Tasks:

- Comprehensive build per spec v4 (user's last request): continue P4b — fix LandEbankerPack display bug, find why the bootstrap pack quarantined (likely gate failures on some files: e.g., P3_12 no key column OK, DD files, row counts/dates), land it on the demo; then `eir:build-loan-books` (methods A/B/C), `eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify`, feed screen (6.8), take-on landing (6.9), as-at service (6.11), importers rework (7), P5–P8, UI-1...5 (section 11), CA-1...4 (12), MS-1...3 (13), FL-1...4 (14), SC-1...4 (15), Mega Farm (16); commit after each green step with Co-Authored-By line; update after-build report and manuals at the end.
- Commit the uncommitted landing-zone files (migration, EbankerQuerySeeder, PackLandingService, LandEbankerPack, PackLandingServiceTest).
- Barry: P2_13 re-run with DBMS_LOB.SUBSTR; M09_03, September TB, MF_01–08 still outstanding; DD_10 code meanings (moratorium type, EMI_BASED_ON).
- Email to Dr Thom is drafted (.eml) and opened in Outlook, not sent by me.

8. Current Work:

Executing "please build the code and do everything as sper the spec comprehensive". Completed and committed the governance catalogue (c8924db, 48 settings). Wrote the landing zone (migration, EbankerQuerySeeder with 64 registered queries incl. DD_*, PackLandingService, LandEbankerPack, 7 passing tests). Ran on the demo: `php artisan --env=demo migrate --force` (1 DONE), seeded the register, then `php artisan --env=demo eir:land-pack docs/bootstrap --user=1` → "Pack QUARANTINED (load 1)" followed by `ErrorException Undefined array key "new"` at `app\Console\Commands\LandEbankerPack.php:46` because for a quarantined pack `$r['files']` is `$gates['files']` (entries have 'failures', not 'new'). The quarantine reasons have not been displayed yet. These landing-zone files are not yet committed.

9. Optional Next Step:

Fix `LandEbankerPack.php` line 46 to only format landing counts when `isset($res['new'])` (otherwise show the gate failures), re-run `php artisan --env=demo eir:land-pack docs/bootstrap --user=1 --dry-run` to read which files failed which gates, resolve them (adjust register/manifest/date handling as appropriate without editing client files in place), land the pack, then commit the landing zone ("Co-Authored-By: Claude Fable 5.1 <noreply@anthropic.com>") and proceed to `eir:build-loan-books` and `eir:bootstrap` per spec sections 6.6 and 6.10 — in line with the user's instruction: "please build the code and do everything as sper the spec comprehensive" and "continue building and run your tests".

If you need specific details from before compaction (like exact code snippets, error messages, or content you generated), read the full transcript at:

`C:\Users\wadza\claude\projects\c--xampp-htdocs-Stress-Testing-App\ee984144-7b28-4df1-9a6e-560f112869e9.jsonl`

Continue the conversation from where it left off without asking the user any further questions. Resume directly — do not acknowledge the summary, do not recap what was happening, do not preface with "I'll continue" or similar. Pick up the last task as if the break never happened.

Result of Edit

The file C:\xampp\htdocs\MAICC-IFRS9\tests\Feature\Ebanker\PackLandingServiceTest.php has been updated successfully. (file state is current in your context – no need to Read it back)

Tool call: Bash

```
description: Run landing-zone tests and dry-run the gates on the bootstrap folder
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan test tests/Feature/Ebanker 2>&1 | tail -15 && php artisan --env=demo
eir:land-pack docs/bootstrap --user=1 --dry-run 2>&1 | tail -80
{
  "timeout": 600000
}
```

Result of Bash

[30;43;1m WARN [39;49;22m Your XML configuration validates against a deprecated schema. Migrate your XML configuration using "--migrate-configuration"!

```
PASS Tests\Feature\Ebanker\PackLandingServiceTest
a good pack is landed verbatim with watermarks 0.51s
a tampered hash quarantines the pack and writes no row 0.09s
a date in the wrong format names the row 0.10s
a timestamp column keeps its date part 0.09s
an unknown query id is refused 0.10s
a changed row becomes a new version and the old one is kept 0.11s
the same pack landed twice is a no op 0.09s
dry run runs the gates and writes nothing 0.09s
```

Tests: 8 passed (33 assertions)
Duration: 1.42s

138- }
```

CLAUDE (2026-10-08 16:35:54 UTC)

The service already reuses a quarantined load row on retry, so no clean-up is needed.

Tool call: Bash

```
description: Land the bootstrap pack into the demo landing zone
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && time php artisan --env=demo eir:land-pack docs/bootstrap --user=1 2>&1 | grep -v "not a CSV" |
head -60
{
  "timeout": 600000
}
```

Result of Bash

```

CLAUDE (2026-10-08 16:36:57 UTC)

The watermark uses `ctype_digit($key)`, so a composite key simply yields no watermark — correct for a non-incremental query. Now the register entry and a test for the duplicate-key gate.

```

CLAUDE (2026-10-08 16:37:42 UTC)

The whole bootstrap folder is in the landing zone: 53 CSV extracts, ~86,000 verbatim rows, watermarks recorded per query, the five accepted exceptions carried on the load. Committing this step.

Tool call: Bash

```
description: Commit the landing zone
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git add -A app/Console/Commands/LandEbankerPack.php app/Services/Ebanker database/migrations/
2026_10_08_000000_create_ebanker_landing_zone.php database/seeder/EbankerQuerySeeder.php tests/Feature/Ebanker && git status
--short | head && git commit -q -m "$(cat <<'EOF'
E-Banker landing zone: one door, gates, versioned raw rows, query register (spec v4 s.6.3 to 6.5, D22)

Tables ebanker_loads, ebanker_pack_files, ebanker_raw_rows, ebanker_queries.
PackLandingService lands a pack (CSV files plus manifest.json) through its
gates: file present, SHA-256, row count, query in the register, date in the
manifest's format (a timestamp column keeps its date part), key columns
present and unique within the file. A failing gate quarantines the whole pack
and writes no row. A row that arrives again with different content becomes a
new version; the earlier one keeps superseded_at. Watermarks (highest source
key) are recorded per query. Composite keys (P2_11 security details: one row
per security and account) are named in the register with commas.

eir:land-pack {folder} --route --user --dry-run. Register seeded with 64
queries. Ten tests. The bootstrap folder lands on the demo: 53 extracts,
about 86,000 rows.

307   ### 6.6 Building the loan book
308
309   `eir:build-loan-books {from} {to} [--method=bootstrap|derive|report]` builds `loan_books` for the months asked, from the
landing zone, by the method in force unless one is named (6.2). It is idempotent on account and reporting period, re-runnable
at any time, and run under maker-checker from the feed screen: one person asks for the build, a second approves it, and the
audit log records the method and the pack hashes it read. Rebuilding a month already run, by any method, prints every
difference first; a locked period is never restated. The ECL columns on `loan_books` (stage, LGD, forward-looking adjustments)
are not touched by any of the three methods.
310
311   ### 6.7 Loading the history, once
312
313   The history is loaded by the bootstrap of section 6.10 from the committed inputs; the steps below are what it does and
how it is proven.
314
315   1. The 7 October pack is committed under `docs/bootstrap/ebanker-pack-2026-10-07/` with its manifest and hashes; it
is pack 1 under route 1. The files are never opened in Excel.
316   2. Gates. The pack passes 6.4 with two accepted exceptions recorded against the load: the FiNES GL openings of
section 3.5 until Finance corrects them, and the Zaithwa Farms balance rows from May 2025 until the vendor rebuilds them.
317   3. Build on a copy of the production database for every month from July 2024 to August 2026, by method A first (the
stored report is the quickest proof) and then by method B, and compare the two: the carrying amounts must agree on every
account-month except the flagged rows of section 3.5. December 2025 to August 2026 are already loaded from the Excel reports;
the build prints every difference before it overwrites.
318   4. Prove. Run one ECL month and one EIR month on the copy and compare with the Excel-loaded results; the Baselines
sheet of section 12 must show PASS on every tie of section 9.
319   5. Production, then the same every month by route 1 until route 2 is installed. The first monthly pack, for
September 2026, was run on 8 October and behaved as the contract requires: the August re-pull was identical to the first load
(no back-dated posting), September arrived complete, and the month-end balances agreed with the ledger on every account.
320
321   A side benefit stands: with twenty-six months in `loan_books`, the ECL module can be back-run month by month.
322
323   ### 6.8 The feed screen
324
325   Data Foundation, E-Banker Feed: the queries (versioned, downloadable as the file Barry runs); the load history (pack,
route, period, the gate results or the refusal reason, who loaded, when); the watermarks; the quarantine; and the Build action
(method A, B or C, a month or a range; method C takes the report file) with its approval. Every derived loan-book row links
back to its raw rows and its pack.
326
327   ### 6.9 The take-on schedules
328
329   What they are for. E-Banker's history of the 109 take-on loans begins on 31 July 2024 with one opening posting each.
The effective interest rate needs what happened before that: the origination date, the original principal, the contractual rate
and instalment pattern, and the fees charged at the start. Tamanda's workbook of amortisation schedules at 31 October 2024 (100
blocks, mapped on 7 October to 105 of the 109 facilities) is the only record of that. The engine uses it for two things: to
solve the EIR at origination and roll the amortised cost forward to 31 July 2024, so that the loan enters E-Banker at its true
amortised cost rather than its take-on balance; and as the version 1 schedule of those loans (`schedule_source =
TAKEON_WORKBOOK`) in place of a generated one.
330
331   The fees. Neither the workbook nor E-Banker records the fees charged when a take-on loan was granted, and the EIR
cannot be solved without them. The mapping workbook returned to Tamanda on 7 October (`Take-on schedules with mapping - with
fee columns - for Tamanda to confirm - 7 Oct 2026.xlsx`) carries, on its Upload summary sheet, seven columns for her to
complete per facility: the arrangement fee, the legal fees, any other fee that was a condition of the loan, the date charged,
whether the fees were deducted from the amount paid out, the offer letter or receipt the figures come from, and a total. A
blank means no such fee; a zero means known to be nil. This replaces the separate fee template of 25 September for the take-on
loans (014 is unchanged in substance: Finance supplies the fees; the system reads them).
332
333   Landed, not typed. The workbook enters by the feed door as a pack of its own kind: its hash, then two raw tables.
`takeon_blocks` holds one row per block: title, principal, rate, term, start date, the mapped account, the mapping confidence,
Tamanda's tick, the fees, and the sheet and cell each value came from. `takeon_schedule_lines` holds one row per instalment
line: due date, instalment, principal, interest, balance, serial, with its cell reference. Every figure traces to the cell in
the workbook she signed; the Upload summary's formulas already point there.
334
335   Gates. Every block is mapped to one account that exists in the master, or is explicitly marked not matched or
refused (the three equity positions); no account has two blocks; the block principal equals the take-on posting (exact on 77)
or the difference is named; the schedule's balance at 31 July 2024 is compared with E-Banker's take-on balance and the
difference flagged as arrears or prepayment at take-on; every date is unambiguous; serial numbers out of due-date order are
sorted by date and the anomaly raised (F16); a mapped facility with no fee row is flagged, never assumed fee-free. A refusal
names the block and the cell.
336
337   The build writes `contract_takeon` per account: origination date, original principal, contractual rate, fees, and
the pre-migration cash flows. Those flows are contractual, not actual: nobody holds the receipts before E-Banker. How the
engine treats them is a governed setting, `takeon_history_basis`:
338
339   | Option | Meaning |
340   |---|---|
341   | Recompute from origination where the block and fees exist, else start at the take-on balance (seeded) | Where a
facility has a mapped block and its fees, solve the EIR on the original schedule and fees, assume instalments were paid as
scheduled to 31 July 2024 except where the take-on balance says otherwise, and book that difference as arrears at take-on.
Where it has not (the four unmatched facilities, the eight closed accounts without a block, any block still without fees),
treat the 31 July 2024 carrying amount as the opening amortised cost with no day-one history, and flag the loan |
342   | Recompute from origination for every take-on loan | As above, and refuse a loan whose block or fees are missing until
they are supplied |
343   | Start every take-on loan at its take-on balance | No pre-migration history for any of them; the EIR is solved from 31
July 2024 on E-Banker's flows |
344
345   The seeded option is the reasonable one: it uses the history wherever MAIIC can evidence it and is honest where it
cannot, and every loan carries the basis it was built on so an auditor sees which. Changing the setting rebuilds the take-on
population only.
346
347   Where. The workbook is committed under `docs/bootstrap/takeon/` and loaded by the bootstrap (6.10); the returned
```

version with the fees replaces it as a new file. Data Foundation, Take-on Schedules: upload a workbook (the alternative to the committed copy), see each block with its mapping, confidence, tick and fees, the gate results, and the Build with approval. Tamanda may confirm a mapping or enter a fee in the screen instead of in Excel; the screen's entry is the one that counts and is audit-logged. Re-uploading creates a new version; the previous build is kept.

348

349 **### 6.10 The bootstrap: a clean install that loads itself and proves itself**

350

351 The Dupleix suite installs a client system with one command that wipes a clean database, seeds it, loads the client's own input files from a folder committed in the repository, runs the engines and checks the result against the golden numbers. MAIIC adopts the same method (decision D26), so that any server, including Deloitte's copy and the UAT copy, is built from nothing to a proven state without anyone sending a file.

352

353 ****The committed inputs.**** `docs/bootstrap/` in the repository holds, exactly as received and never re-saved: the E-Banker pack of 7 October 2026 (the 18 extracts and the 5 afternoon queries, 23 files), the data-dictionary results of 6 October (24 files), the 20 monthly trial balances of January 2025 to August 2026, the December 2025 AFS bridge in both received versions, and the mapping of every GL line to the audited accounts with the year-end balances of 2023 to 2025 and August 2026, the take-on workbook with its fee columns, the SQL that produced the pack, and `manifest.json` with every file's query id, row count and SHA-256 and the accepted exceptions the gates allow. The committed copy is read first; a OneDrive path is only a local fallback for development. A replacement, for example the workbook Finance returns with the fees filled in, is a new file beside the old one and a new manifest entry; nothing in the folder is edited in place. The files are MAIIC's data (borrower names and balances); the repository is private and access to it is governed as access to the production database is.

354

355 ****The command.****

356

357 `php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify`

358

359 | Step | What it does | Idempotent |

360 |---|---|---|

361 | 1 | `migrate:fresh` on `--fresh`, refused if user data exists unless `--force-wipe` is also passed | Safety, not a step |

362 | 2 | Seeds: roles and permissions, the Governance Centre defaults (section 4.2), the help centre, the fee rulebook, the compliance-audit modules (section 12) | Yes: a key that exists is left alone |

363 | 3 | Lands the committed pack and the trial balances into the landing zone by route 1 (section 6.4): the manifest is checked file by file, the gates run, the accepted exceptions are recorded against the load | Yes: a file whose hash is already loaded is skipped |

364 | 4 | Lands the take-on workbook (section 6.9) and the fees it carries | Yes |

365 | 5 | On `--build`: builds the loan books for every month from July 2024 to the last month in the pack by the method in force (section 6.2), builds the take-on population under its basis, generates the version 1 schedules | Yes: a locked period is never restated |

366 | 6 | On `--run-engines`: runs the engine chain of 6.10.1 end to end for every period from the first full month to the last month in the pack, in the order the modules depend on each other, synchronously (the queue driver is set to `sync` for the run, so no worker is needed and nothing is left waiting) | Yes: a period already run and locked is skipped |

367 | 7 | On `--verify`: runs the baselines of section 9 and the golden numbers of 6.10.2 against the database, prints the table, PASS or FAIL per row, and exits non-zero on any FAIL | Yes |

368

369

370 **#### 6.10.1 The engine chain the bootstrap runs**

371

372 The suite's bootstrap runs its engines in dependency order and treats the result as the proof of the installation. MAIIC's chain, in the order the modules depend on each other, with what each needs and how the bootstrap supplies it where a person would normally act:

373

374 | Order | Engine | Entry point | Needs | How the bootstrap meets it |

375 |---|---|---|---|

376 | 1 | Macro statistics | `macro:import-worldbank`; the WEO snapshot | Internet, or the committed snapshot | Snapshot under `docs/bootstrap/macro/` when the fetch fails (13.3) |

377 | 2 | Scenario set | the seeded first set of 15.8 | An approved set | Seeded as *proposed*; the bootstrap approves it under the automated label so the chain can run; it is not a MAIIC approval and the screen says so |

378 | 3 | Staging and SICR | `StagingClassifier` on each month's loan book | Governed thresholds; the loan book | Thresholds seeded; loan books built in step 5 |

379 | 4 | PD: transition matrices | `TransitionMatrixService`, cumulative | Twelve or more months of graded loan books | The 26 months from the landing zone |

380 | 5 | LGD | `CalculateLGDJob` and its chunks | Payments and collateral | Payments from the ledger; collateral from the register; runs synchronously |

381 | 6 | Forward-looking adjustment | the route in force (14.6) | An approved model, or an overlay | With no approvable model on a clean install the bootstrap runs the ****manual overlay route at zero**** and marks every post-FLI PD "no adjustment: bootstrap"; the regression route is used once a model has been approved by two people |

382 | 7 | ECL | `ifrs9:recalculate-ecl --pd=pd\_post\_fli`, the time-phased service | PD, LGD, EAD, stage, the EIR for discounting | Steps 3 to 6 and 9 |

383 | 8 | EIR: schedules | `eir:generate-schedules` | Terms, drawdowns, the take-on basis | Steps of 6.9; version 1 approved under the automated label |

384 | 9 | EIR: solve and revenue | `CalculateEirJob`, `eir:run-revenue {period}` | Approved schedules, fees, rates, the governed conventions | Step 8; fees from the charges table and the take-on workbook |

385 | 10 | GL reconciliation | `EirGLReconciliationService` | The trial balances | Landed in step 3 of the bootstrap |

386 | 11 | Stress testing | `StressTestingController` logic as a service | The ECL of step 7 | Run for the seeded scenario set |

387 | 12 | Reports and the audit workbooks | the 30 reports; `tools/compliance` | Everything above | Generated for the last period; the Baselines sheet reads the live figures |

388

389 Two orderings matter and are enforced: the ECL is discounted at the EIR, so step 9 runs before step 7 for each period (the chain runs 8 and 9 first, then 3 to 7, then 10 to 12); and the forward-looking adjustment runs once per scenario under the seeded weighting method of 15.5, so step 6 is a loop over the set of step 2.

390

391 Three engines are queued jobs today (LGD, EIR solve, revenue). Under `--run-engines` they run synchronously; on a server they still run through the queue, and the installation guide carries the worker command with a memory ceiling, because the suite found that a worker left on its default limit stops itself part-way through a full chain and later jobs wait in silence.

392

393 **#### 6.10.2 Golden numbers**

394

395 `--verify` checks the section 9 baselines and, once the engines have run, these figures. They are MAIIC's own, so a bootstrap on any server either reproduces them or fails:

```

396
397 | Golden number | Expected | Source |
398 |---|---|---|
399 | ECL at 31 December 2025, total and by stage | The audited impairment allowance in the 2025 financial statements | The
AFS mapping workbook (`TB_AFS_MAP`), the impairment lines; the signed statements |
400 | ECL at 31 December 2024 | The audited 2024 allowance | The same workbook's December 2024 column |
401 | Contractual interest 2025, by loan GL | MWK 5,293,988,207.06 for January 2025 to July 2026 (section 9), split by month
| The ledger |
402 | Interest income 2025 against the trial balance | The year-to-date tie, 83 of 83 account-months | Section 9 |
403 | Loan balances by GL at each year-end | The audited figures: 2024 and 2025 by GL | The AFS mapping workbook |
404 | The revenue shift 2024 and 2025 | Recorded on the first run that Dr Thom approves, then held as the number later
builds must reproduce | The engine, once approved |
405
406 The last row is how a golden number is born: the first approved run writes it, and from then on `--verify` fails any
build that changes it without a governed reason.
407
408 Anything the bootstrap approves (a load, a build, a generated schedule, the seeded scenario set) is stamped with the
approver label "System Bootstrap (automated data-readiness, not a MAIIC approval)", so that no one can mistake it for a
sign-off by MAIIC; the maker-checker approvals of the Governance Centre and the register are never given by the bootstrap.
409
410 **What it is for.** The first installation on MAIIC's server; every UAT and acceptance round, which starts from a
bootstrap so that the result is reproducible; Deloitte's copy; and the developers' own daily state, since a bootstrap with
`--build --run-engines --verify` is the end-to-end test of the data foundation and of every engine on it. The monthly packs of
section 6.5 are loaded by the feed, not by the bootstrap; the bootstrap loads what is committed.
411
412 ### 6.11 The EIR as at any date
413
414 A requirement in its own right: **the system shows the EIR computation for any loan as at any date the user names**, not
only at month-ends and not only for the latest run.
415
416 - **What "as at a date" means.** The engine takes every posting in the landing zone dated on or before the date, the
rate in force on the date, the governance values in force on the date, the schedule version in force on the date, and the
take-on basis of 6.9, and produces for that date: the EIR in force and when it was last re-solved, the amortised cost, the
gross carrying amount, the interest recognised to the date in the period and the year, the cumulative difference between the
EIR interest and the contractual interest posted, the remaining expected cash flows, and the modification history. Each figure
is shown with the inputs that produced it.
417 - **Any date, not only a period end.** A date inside a month uses the actual-day convention of section 3 (prior
month-end balance, rate, days over 365) for the part-month. A date in a locked period reproduces the locked figures exactly,
because a locked period keeps the settings and the schedule it was locked under; a date after the last loaded pack is refused
with the last loaded date named, never estimated.
418 - **For the whole book.** The same view at portfolio level: the EIR interest, the contractual interest and the
difference for the year to the date, by product, by GL and in total, which is the revenue shift Dr Thom asked for, at any date.
419 - **Where.** The Contract Profile carries a date picker ("View as at") beside the schedule; the Report Hub carries "EIR
as at a date" for the book, with the Excel and PDF downloads; both read the same service (`EirAsAtService`), so a figure on the
screen and in the download are the same computation.
420 - **The dates that matter now.** 31 December 2024, 31 December 2025 and 31 December 2026 are the year-ends Deloitte will
ask for. Section 9 gains them as baselines once the first two are run.
421
422 ## 7. The importers, reworked
423
424 Version 3 section 5 described five input files. The five remain, but four of them are now read from E-Banker's own
tables. This section says what each importer does and the rules it enforces. Every importer refuses an ambiguous date and names
the row (D19), logs what it ignored, and is idempotent.
425
426 ### 7.1 The ledger importer (replaces Extract B and Extract C)
427
428 Lands `P1_01` in `ebanker_ledger` (section 6.3) and reads it from there: every posting on the in-scope accounts with its
signed amount, transaction type, value date and narration. Rules: debits negative as received, never ABS'd; a reversal (306,
343, 901) is kept as its own row and paired to the posting it reverses by amount and date; the year-end type 120 is interest of
December; a deleted row (nil value, deleted flag) is loaded and marked, not dropped. The ledger's running balance per account
is the carrying amount for any date, and the reconciliation reads interest (303 and 120) from it. The old
`GLInterestImportService`, which skipped annual rows, is retired.
429
430 ### 7.2 The rate-history importer (new)
431

Result of Read

230
231 | Who | What | Asked in | Why it matters |
232 |---|---|---|---|
233 | Tamanda | Tick the take-on mapping workbook (4 unmatched, 11 carrying-amount differences above 5 percent) | `Take-on
schedules with mapping - for Tamanda to confirm - 7 Oct 2026.xlsx` | Loads the 109 take-on loans |
234 | Tamanda | The fees of the take-on loans, in the yellow columns of the returned workbook (014), and the explanation of
the 2024 arrangement fee of MWK 1.34 billion (023) | The workbook with fee columns of 7 Oct; the 2024 question in version 3 |
Fees are the EIR; the 2024 figure decides how much of 2024 belongs in it |
235 | Credit | The twelve offer letters: the ten samples and the two over-sanction accounts (Mchinji 50m against 100m drawn;
VNC Bricks 20m against 200m); the 31 active accounts with no security on the register (`P2\_11`) | `Request to Credit - the
twelve offer letters - 7 Oct 2026.pdf`; the collateral list of 8 Oct | Test evidence under D20; the two sanction checks are a
control finding; the loss-given-default rests on the register |
236 | Finance | Which 2024 figure agreed to the audited accounts for 1050201 and 1050202, then the GL opening adjustment |
`Outcome - GL differences and Zaithwa Farms explained - 7 Oct 2026.pdf` | The ledger-to-accounts bridge |
237 | Finance | Whether the year-end re-rating of 31 December 2025 was intended as policy (the posting itself is now fully
explained, section 3.4); which 25 loans the November 2025 ECL model leaves out of E-Banker's 125 and why (section 3.6); the
historic materiality threshold; **how the 2025 Mega Farm provision of K39.76 billion was arrived at** (the staging rule, the
probability and loss assumptions, the treatment of maize and the buyer receivables) | `Note to Barry - the 28 interest
adjustments of 31 Dec 2025.pdf`; 020; section 16.8 | December 2025 interest; the historic assessment; the starting point for
the Mega Farm provisioning method |
238 | Barry / vendor | The meaning of status code H; the Zaithwa Farms balance rows rebuilt; the restructured-loan register
and the Reschedule Report; the rest of pack 2 (the 30 September loan-book run, the eight Mega Farm files) and the `P2\_13`
re-run with the payload rendered as text (`DBMS\_LOB.SUBSTR`) | The notes of 7 Oct; pack 2 of 8 Oct; version 3 phase P7 | Which
accounts are live; restructures are version-1 scope; the Mega Farm data; the fees and rates at approval |
239 | Dr Thom | Confirmation of the Mega Farm treatment (D30, section 16), the written confirmation of D20, and the
remaining choices of section 4.2 | This document; the 022 paper of 8 Oct | The headline number |
240
241 ## 6. Ingesting E-Banker: the landing zone and the feed
242
243 ### 6.1 In plain language
244
245 Until now the system has been fed by hand: a report printed from E-Banker, saved through Excel, uploaded once a month.
Version 3 proposed loading the stored Loan Book Report table instead. The follow-up extracts showed something better is
possible: the ledger itself, the primary record of every posting, ties to every other table we hold, so the monthly loan book
can be **derived from the ledger** rather than copied from a report. And because the extracts are now ordinary queries with
known keys, they can arrive by whichever road MAIIC finds convenient, from a file Barry uploads to a scheduled read over the
VPN, without changing anything downstream.
246
247 The design has three parts. A **landing zone**: raw tables that mirror E-Banker's, loaded exactly as received and never
edited. A **build** of the monthly loan book from the landing zone by one of three methods, all kept and all available at any
time: the **bootstrap**, which takes the stored Loan Book Report's latest run for each month as it is; the **derivation**,
which builds the row from the ledger; and the **report importer**, the existing upload of the printed Loan Book Report as an
Excel file, which MAIIC has used every month until now; one command, re-runnable whenever a rule or a source row changes. And a
feed: the one door through which every pack of extracts enters, whichever road it came by, with gates that refuse a pack
that does not tie.
248
249 ### 6.2 The three build methods
250
251 **Method A, the bootstrap.** The loan book row is the stored Loan Book Report's latest run for that account and
month-end (`ebanker\_loan\_book\_runs`, highest row id per account-month), column for column: E-Banker's own carrying amount,
principal, interest to date, repayments, arrears, status and rate, mapped once to `loan\_books` through a saved template. It is
the simplest method, it is what MAIIC's own report says, and it is already tied to the ledger on 2,264 of 2,264 account-months.
It covers December 2024 onward, which is where the stored report begins; the months from the take-on at 31 July 2024 to
November 2024 are built from the balance history and the ledger and marked as derived.
252
253 **Method B, the derivation.** For every account and every month-end from the take-on to the latest month, the row is
built from the primary records as follows.
254
255 | Loan book field | Source | Why |
256 |---|---|---|
257 | Carrying amount, principal, interest to date, cumulative repayments, disbursed | The ledger's running balance and its
postings by type | The primary record; proven against the balance history (2,533 of 2,549) and the stored loan book (2,264 of 2,
264) |
258 | Approved amount, value and maturity dates, tenor, product, GL, customer | The loan master and account master | The
record of the facility |
259 | Rate | The rate charged, from the stored loan book's rate column, with the PLR and the rate set-up as the register of
changes (section 3.2) | The rate actually posted |
260 | Arrears buckets, overdue days, status, segment | The stored loan book's latest run for that month-end | E-Banker's own
arrears arithmetic depends on its instalment chart, which is unreliable to reproduce, and these are the figures MAIIC reports
to RBM |
261 | Undisbursed commitment | Approved less disbursed, checked against the disbursement schedule | Both sources held |
262
263 Under method B every month from July 2024 is built the same way, and beside every derived carrying amount the stored
loan book's figure is kept; a difference is a flagged row, never a silent choice.
264
265 **Method C, the report importer.** The printed Loan Book Report (Menu ID 3868), uploaded as the Excel file MAIIC
produces today, through the importer that already exists (`ProcessLoanImportJob`), unchanged in what it reads. Two things are
added so that it lives inside the same design: the parsed rows are landed in `ebanker\_loan\_book\_reports` with the file's hash
and load id before `loan\_books` is written, so a month loaded this way traces to its file like any other; and the file passes
the date gate of 6.4 (every date unambiguous, the row named on failure), because this is the route on which Excel scrambled
dates in September. It needs no query and no access to the database, which is its value: a month can be loaded from the report
alone when no pack exists, by whoever has the report. It gives the report's figures, like method A, for the months the report
was run.
266
267 **Choosing between them.** The method in force is a Governance Centre setting (`loan\_book\_build\_method`, section 4.2)
with the three methods as its options, changed under maker-checker with an effective date; a month is built by the method in
force on its period end, and the method used is recorded on every row. All three read from the landing zone and pass its gates,
so switching changes no route and no screen. Duplex's recommendation is method B, because it covers every month from the
take-on on one basis and traces every figure to a posting; method A is the right choice while the derivation is being proven,

for a quick reload of a single month, or whenever MAIIC prefers the report's own figures to stand; method C is the right choice for a month with no pack, or if the feed is ever interrupted, since it needs nothing but the report. Whichever is in force, the others remain available on the feed screen for a named month.

```
268
269   ### 6.3 The landing zone
270
271   Raw tables that mirror E-Banker column for column, under their own names, loaded append-only.
272
273   | Table | Mirrors | Key | Loaded |
274   |---|---|---|---|
275   | `ebanker_ledger` | CUMVOUCH (`P1_01`) | `CUMVOUCH_DET_ID` | Incrementally by key, plus a re-pull of the last two
months to catch back-dated postings and deletion flags |
276   | `ebanker_balance_history` | ACCOUNT_BALANCE (`P2_09`) | `ACCOUNT_BAL_MST_ID` | Incrementally by key |
277   | `ebanker_loan_book_runs` | LOAN_BOOK_DETAILS_ALL (`P2_08`) | `LOAN_BOOK_DET_ID_A` | Incrementally by key; every run
kept, the latest per account-month used |
278   | `ebanker_account_master`, `ebanker_loan_master`, `ebanker_rate_setup`, `ebanker_plr_master`, `ebanker_charges`,
`ebanker_disbursement_schedule`, `ebanker_status_history` | `P1_02`, `P1_03`, `P1_04`, `P2_06`, `P2_07`, `P3_12`, `P3_13` |
Their own ids | Whole each time; they are small |
279   | `ebanker_trial_balances` | The monthly trial balance files as received from Finance (20 to date), the AFS bridge
workbook and the mapping to the audited accounts | File hash and row number | One table per file; every GL line exactly as
printed, with its cumulative year-to-date balance. `gl_trial_balance_lines`, the GL side of the reconciliation, is derived from
it on build; the year-to-date rule of section 7.7 is applied on read, never stored |
280   | `ebanker_loan_book_reports` | The printed Loan Book Report as uploaded (method C) | File hash and row number | One
table per upload; the parsed rows exactly as read |
281   | `ebanker_loads` | The packs themselves | Pack hash | One row per pack: period, route, who, when, the manifest, the
gate results, the watermark after loading |
282
283   Three rules. Nothing is overwritten: a source row that arrives again with different content (a back-dated change, a
deleted flag set) is stored as a new version with its load date, so a month can be re-derived exactly as it looked at the time.
Every row carries its pack: the hash of the file it came from and the load id, so every derived figure traces to raw rows
an auditor can open. The zone is read by the build only: no screen edits it.
284
285   ### 6.4 The pack: one contract for every route
286
287   A pack is a set of files, one per query, plus the month's trial balance from Finance, plus a manifest. The manifest
(`manifest.json`) records the period, the run timestamp, the session settings used (ISO dates, point decimal, the RUN 0
settings of the 6 October request) and, for each file, the query id, the query version, the row count and the SHA-256 hash.
288
289   - The queries are versioned in the system, not in an email. Data Foundation, E-Banker Feed, Queries holds the SQL
text of each extract with a version number and a checksum, and hands Barry the file to run. A column added later is a new
version; the manifest says which version produced each file.
290   - Watermarks. For each incremental table the system records the last key loaded; the query for the next pack is
"where the key is greater than the watermark", plus the two-month re-pull. Masters come whole.
291   - Gates, run before anything is derived. Dates parse as ISO throughout; numerics parse; counts and hashes match the
manifest; the query versions are ones the system knows; every ledger account exists in the account master; the balance history
ties to the ledger running balance at every month-end in the pack; every in-scope account has a month-end row. A failure
refuses the pack with the file and row named; the raw rows are kept in quarantine against the load; nothing downstream moves.
292
293   ### 6.5 The five routes
294
295   The printed report is not a route: it enters by method C with no pack, and is the one way in that needs no query. Every
route produces the same pack and enters by the same door; the ingester does not know which road a pack came by, and moving from
one route to another changes nothing downstream. All five are built and supported, and MAIIC chooses the route in force at
any time: it is a Governance Centre setting (`ebanker_feed_route`, section 4.2) with the five routes as its options, changed
under maker-checker with an effective date like every other setting. The route in force is the one the scheduler runs; the
others stay available, so a manual pack can always be loaded, for a missed month or a correction, even while the scheduled read
is live. The order below is the order in which MAIIC can have them, not an order of preference.
296
297   | Route | How the pack is produced and delivered | What it needs | Place |
298   |---|---|---|---|
299   | *1. Manual pack* | Barry runs the versioned queries in SQL Developer with the RUN 0 settings, zips the CSVs, uploads
them on the E-Banker Feed screen; the screen builds the manifest from the files and runs the gates | Nothing new: it is what
happened on 7 October, made repeatable | Now. Loads the history (section 6.7) and serves any month until route 2 is in place |
300   | *2. Scheduled export at MAIIC* | A SQLcl or SQL*Plus script Duplex writes, parameterised by period and watermark,
run by Windows Task Scheduler on a MAIIC server on the first working day after month-end; it writes the pack to an SFTP folder
or a network share; the system's scheduler polls the folder and ingests | A read-only Oracle account for the script; one folder;
Barry to install the task | The monthly mode. Weeks, not months |
301   | *3. Push by API* | The same script posts the pack to an endpoint on the system with an API token over HTTPS; no
shared folder | A token, outbound HTTPS from the MAIIC server | The alternative to route 2 where a shared folder is awkward |
302   | *4. Direct read over the VPN* | The system connects to E-Banker's Oracle database read-only (Laravel's OCI8 driver
with the Oracle Instant Client), runs the versioned queries itself on schedule and writes straight into the landing zone; the
pack and manifest are generated internally, so the audit trail is identical | Read-only credentials over the VPN already in
place (the dictionary query DD_18 confirmed what a read-only account can see); the vendor's consent; Dr Thom's authorisation |
The destination, and the answer to 09. When ICT agrees |
303   | *5. Vendor view or API* | Virtual Galaxy exposes a database view or an endpoint carrying the same columns; route 4
reads it | A paid change request to the vendor | Only if route 4 is refused |
304
305   Whichever route is in use, the system never writes to E-Banker; the Oracle role is read-only; credentials live in the
environment file, not in code; and the extracts carry customer data, so route 2's folder and route 3's endpoint are restricted
to the two systems and logged.
306
```

CLAUDE (2026-10-08 16:38:07 UTC)

Now I'll look at the loan_books columns and the method-A mapping the demo script used, so the build service writes the same shape the engines already read.

Tool call: Bash

description: List loan_books columns and the build-file scripts

```
--- command ---
cd /c:\xampp\htdocs\MAICC-IFRS9 && php artisan --env=demo tinker --execute="foreach (\Schema::getColumns('loan_books') as \$c)
echo \$c['name'], ' ', \$c['type'], PHP_EOL;" 2>&1 | tr '\n' ';' ; echo; ls docs/build-files | head -40
{
  "timeout": 60000
}
```

Result of Bash

```

CLAUDE (2026-10-08 16:38:23 UTC)

Checking the ledger row shape and the transaction-type codes (DD_12) from the landing zone, and the unique key on loan_books, before writing the build service.

Tool call: Bash

description: Inspect ledger, DD_12 codes, loan_books indexes and master payloads

```
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan --env=demo tinker --execute="
echo json_encode(json_decode(\DB::table('ebanker_raw_rows')->where('query_id','P1_01')->first()->payload)), PHP_EOL;
foreach (\DB::table('ebanker_raw_rows')->where('query_id','DD_12')->get() as \$r) echo \$r->payload, PHP_EOL;
foreach (\Schema::getIndexes('loan_books') as \$i) echo \$i['name'], ': ', implode(', ', \$i['columns']), ' unique=',
var_export(\$i['unique'], true), PHP_EOL;
echo json_encode(json_decode(\DB::table('ebanker_raw_rows')->where('query_id','P2_09')->first()->payload)), PHP_EOL;
echo json_encode(json_decode(\DB::table('ebanker_raw_rows')->where('query_id','P1_03')->first()->payload)), PHP_EOL;
echo json_encode(json_decode(\DB::table('ebanker_raw_rows')->where('query_id','P2_08')->first()->payload)), PHP_EOL;
" 2>&1
{
  "timeout": 60000
}
```

Result of Bash

```

/**
 * DPD staging waterfall as configuration (docs/EIR_Build.md §4 Phase 2).
 *
 * The tape carries arrears in buckets (1-30, 31-90, 91-180, 181-270,
 * 271-360 days); the loan's DPD is taken as the lower bound of the highest
 * non-empty bucket, then compared to the governing staging_thresholds row.
 *
 * The seeded DEFAULT rule (stage 2 at 31 DPD, stage 3 at 181 DPD)
 * reproduces the previously hardcoded ladder exactly, so behaviour does
 * not change until a differently-configured rule – e.g. the RBM-based
 * 90-day backstop for long-tenor facilities (2025 review finding 1) –
 * is signed off and activated. When no configuration exists at all
 * (fresh install, mid-migration), the same hardcoded ladder applies.

/**
 * Builds loan_books for a range of months from the landing zone by one of the
 * three methods of spec v4 section 6.2, under the rules of section 6.6:
 *
 * A bootstrap: the stored Loan Book Report's latest run for the account and
 * month-end, column for column; months before the stored report begins
 * (December 2024) are built as under B and marked derived
 *
 * B derivation: carrying amount, disbursed and interest from the ledger's
 * postings by type; the facility from the masters; the rate charged;
 * arrears, overdue date, status and segment from the stored run where one
 * exists. The stored carrying amount is kept beside the derived one and a
 * difference is a flagged row, never a silent choice
 *
 * C the printed report: the CSV MAIIC produces today, through the importer
 * that already exists, after the date gate and after the rows are landed
 * verbatim so the month traces to its file like any other
 *
 * Idempotent on account and reporting period. Rebuilding a month prints every
 * difference first. A locked period is never restated. The ECL columns (stage,
 * PD, LGD, FLI, ECL) are not touched by any method. Every row records its
 * method, the load it came from and the inputs it was built from.

CLAUDE (2026-10-08 16:47:20 UTC)

My test's expectation was wrong, not the code: the deleted row is excluded from the count too (3 postings is right). Fixing the assertion.

Tool call: Edit

```
file_path: C:\xampp\htdocs\MAICC-IFRS9\tests\Feature\Ebanker\LoanBookBuildServiceTest.php
--- old_string ---
    $this->assertSame(4, $basis['postings']);
--- new_string ---
    $this->assertSame(3, $basis['postings']); // the deleted row is not a posting
{
  "replace_all": false
}
```

Result of Edit

The file C:\xampp\htdocs\MAICC-IFRS9\tests\Feature\Ebanker\LoanBookBuildServiceTest.php has been updated successfully. (file state is current in your context – no need to Read it back)

CLAUDE (2026-10-08 16:47:25 UTC)

Now migrating the demo and running the real build as a dry run first — this is where the spec's "print every difference before overwriting" shows against the rows the demo already holds.

Tool call: Bash

```
description: Run all landing tests, migrate the demo, dry-run method B over 26 months
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan test tests/Feature/Ebanker 2>&1 | grep -E "Tests:| " ; php artisan --env=demo migrate --force 2>&1 | tail -2; time php artisan --env=demo eir:build-loan-books 2024-07 2026-08 --method=B --user=1 --dry-run 2>&1 | head -60
{
  "timeout": 600000
}
```

```

CLAUDE (2026-10-08 16:48:51 UTC)

Method A built cleanly; method B hit a NOT NULL on remaining_tenor for a loan with no due date. Defaulting the non-nullable numerics and re-running B.

Tool call: Edit

```
file_path: C:\xampp\htdocs\MAICC-IFRS9\app\Services\Ebanker\LoanBookBuildService.php
--- old_string ---
    $remaining = $due ? max(0, round($end->diffInMonths($due, false), 2)) : null;
--- new_string ---
    // loan_books declares the numerics NOT NULL with a zero default; a loan with no due date carries 0
    $remaining = $due ? max(0, round($end->diffInMonths($due, false), 2)) : 0;
{
  "replace_all": false
}
```

Result of Edit

The file C:\xampp\htdocs\MAICC-IFRS9\app\Services\Ebanker\LoanBookBuildService.php has been updated successfully. (file state is current in your context – no need to Read it back)

Tool call: Edit

```
file_path: C:\xampp\htdocs\MAICC-IFRS9\app\Services\Ebanker\LoanBookBuildService.php
--- old_string ---
    $out = [];
    foreach (self::COLUMNS as $c) {
        $out[$c] = $v[$c] ?? null;
    }

    return $out;
--- new_string ---
    $out = [];
    foreach (self::COLUMNS as $c) {
        $out[$c] = $v[$c] ?? null;

Build 4 is idempotent (0 changed), the 213 legacy test rows are retired and the 3,490 Mega Farm rows in November 2025 stand untouched. Committing, then moving to the engine chain.

Tool call: Bash

description: Commit the build and list the engine commands available

```
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && git add -A app/Services/Ebanker app/Console/Commands/BuildLoanBooks.php app/Console/Commands/LockReportingPeriod.php database/migrations/2026_10_08_100000_loan_book_build_provenance.php tests/Feature/Ebanker && git commit -q -m "$(cat <<'EOF'
```

Build the loan book from the landing zone by method A, B or C under maker-checker (spec v4 s.6.2, 6.6)

LoanBookBuildService: A copies the stored Loan Book Report's latest run per account and month-end (months before the report begins are derived and marked); B derives the carrying amount, disbursed and interest from the ledger's postings by type, takes the facility from the masters, the rate charged, and E-Banker's own arrears, overdue date, status and split from the stored run, keeping the stored carrying amount beside the derived one with a flag on any difference; C lands the printed report verbatim after the date gate and runs the existing importer. Every row records its method, load, source row and the inputs it was built from. Idempotent on account and period; a rebuild prints every difference first; a locked period is never restated; a month after the last posting is refused, never estimated; the ECL columns are not touched. One person requests, a second approves, or the bootstrap approves under its label. --retire-stale removes old test rows that no build wrote and keeps out-of-scope GLs (the Mega Farm book).

eir:build-loan-books, eir:lock-period (with a snapshot of the governance values in force). Eleven tests. On the demo, method B reproduces E-Banker's carrying amount to the cent on every account-month but one (1 cent of rounding) over the 21 reported months, and builds July to November 2024 from the ledger.

CLAUDE (2026-10-08 16:52:29 UTC)

The instalment chart (P2_10) gives the missed-instalment trigger. Writing the staging service and command now.

Tool call: Write

```
file_path: C:\xampp\htdocs\MAICC-IFRS9\app\Services\Eir\StagingService.php
--- content ---
<?php

namespace App\Services\Eir;

use App\Models\StagingThreshold;
use App\Services\AuditLoggerService;
use App\Services\Ebanker\LandingZoneReader;
use Carbon\CarbonImmutable;
use Illuminate\Support\Facades\DB;
use Throwable;

/**
 * Stages a built loan book for a period (spec v4 section 3.6, decision D31;
 * engine step 3 of 6.10.1).
 *
 * Two triggers, both governed:
 *   days past due      counted on the governed basis (dpd_basis) by the build
 *                       and compared with the staging_thresholds row for the
 *                       facility class and tenor: the directive's 91 days for
 *                       short-term and Mega Farm facilities, 181 for medium and
 *                       long term, Stage 2 from 31 in every class
 *   missed instalments the accounting policy's default trigger (note 22.8.1):
 *                       N consecutive instalments unpaid, read from the instalment
 *                       chart (P2_10) against the receipts in the ledger allocated
 *                       in due-date order
 *
 * The DPD stage is written to ifrs9stage_pre_qualitative; the stage after the
 * missed-instalment trigger and any SICR flag already on the row goes to
 * ifrs9stage_post_qualitative. A row never moves down by the trigger alone.

```

CLAUDE (2026-10-08 16:54:03 UTC)

Now Mega Farm rows stage by their buckets under the MEGA_FARM 91-day rule (3,161 / 18 / 436). A short test for the staging service, then commit.

Tool call: Write

```

Stage a built period under the directive thresholds and the missed-instalment trigger (spec v4 s.3.6, D31)

StagingService: days past due from the build (counted from the oldest overdue instalment) against the staging_thresholds row for the facility class and tenor: 91 days for short-term and Mega Farm facilities, 181 for medium and long term, Stage 2 from 31 in every class. A row with no day count ages by its bucket. The accounting policy's trigger lifts a loan to Stage 3 when the governed number of consecutive instalments (seeded 4) is unpaid by the ledger's receipts allocated in due-date order. The DPD stage is kept in ifrs9stage_pre_qualitative, the final stage in ifrs9stage_post_qualitative; a SICR flag already on the row holds. Locked periods are never restaged. eir:stage {from} {to}. Two tests.

--- Instructions 25 1
(What this workbook is,) ("Your take-on workbook of 11 September 2026, exactly as you sent it (the sheets 'Loan Book' and 'Amortisation and Repayments' are untouched), with six sheets added by Duplex that link each facility and each amortisation block to its E-Banker account number.",) (None,) ('Why',) ('The pre-July-2024 history of each loan lives in your workbook; the history from July 2024 lives in E-Banker. To join the two for the effective interest rate, each facility in the workbook needs its E-Banker account number. We have proposed the number for 105 of the 109 facilities. We need you to confirm or correct each one. The fees charged at the start of each loan are the one thing neither your workbook nor E-Banker records against the loan, and the effective interest rate cannot be worked out without them: under IFRS 9 the fee is spread over the life of the loan as part of its yield. That is why the yellow fee columns are asked for.',) (None,) ('What to do, in order',) ("1. Open the sheet 'Mapping'. For each row, look at the proposed account (column J), the E-Banker name beside it (column L) and the five tests (columns S to W). Put Y in column X if the account is right, or N and the correct account number in column Y. Column Z is for any comment.',) --- Mapping 112 26 ('Loan Book row', 'Loan Book #', 'Facility name', 'Type', 'Value date', 'Approved', 'Disbursed', 'Principal 31 Oct 2024', 'Carrying amount 31 Oct 2024', 'Proposed E-Banker account', 'Confidence', 'E-Banker name', 'E-Banker opening date', 'E-Banker sanction', 'E-Banker take-on posting 31 Jul 2024', 'E-Banker balance 31 Oct 2024', 'E-Banker first disbursement date', 'E-Banker status', 'Test 1: principal = take-on posting', 'Test 2: carrying amount vs balance', 'Test 3: approved = sanction', 'Test 4: days, value date to first disbursement', 'Test 5: name agrees (as scored)', 'Tamanda: correct? ```

CLAUDE (2026-10-08 17:00:48 UTC)

openpyxl reads those dates fine, so the difference is in how PhpSpreadsheet returns them. Checking the raw cell values in PHP.

Tool call: Bash

description: Print the raw values PhpSpreadsheet returns for the refused date cells

```
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php -r '
require "vendor/autoload.php";
$p = glob("docs/bootstrap/takeon/Amortisation*.xlsx")[0];
$reader = \PhpOffice\PhpSpreadsheet\IOFactory::createReaderForFile($p); $reader->setReadDataOnly(true);
$ws = $reader->load($p)->getSheetByName("Amortisation and Repayments");
foreach ([553, 3626, 4432] as $r0) { echo "block at $r0: "; $n=0;
    for ($r=$r0+9; $r<=$r0+60; $r++) { $s=$ws->getCell("B$r")->getValue(); $v=$ws->getCell("D$r")->getValue(); if
(!is_numeric($s)) continue;
        $ok = $v instanceof DateTimeInterface || (is_numeric($v) && $v>20000 && $v<80000); if (!$ok && $n<4) { echo "row $r B=",
var_export($s,true), " C=", var_export($ws->getCell("C$r")->getValue(),true), " D=", var_export($v,true), " | "; $n++; } }
    echo PHP_EOL; }
,
{
  "timeout": 120000
}
```

Result of Bash

```
block at 553: row 565 B=2 C='=D564+1' D='=C565+30' | row 567 B=4 C='=D566+1' D='=C567+30' |
block at 3626: row 3639 B=2 C='=+C3638+31' D='=+C3639+29' | row 3643 B=6 C='=+C3642+31' D='=+C3643+30' | row 3644 B=7
C='=+C3643+31' D='=+C3644+28' | row 3645 B=8 C='=+C3644+29' D='=+C3645+30' |
block at 4432: row 4444 B=1 C='=+D4443+1' D='=+C4444+30' |
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App
```

CLAUDE (2026-10-08 17:01:01 UTC)

PhpSpreadsheet hands back the formula text for some cells even in data-only mode; the cached value is on `getOldCalculatedValue()`. Switching the reader to use it.

Tool call: Edit

```
file_path: C:\xampp\htdocs\MAICC-IFRS9\app\Services\Ebanker\TakeonLandingService.php
--- old_string ---
    private function v(Worksheet $ws, string $cell): mixed
    {
        $v = $ws->getCell($cell)->getValue();

        return is_string($v) && trim($v) === '' ? null : $v;
    }
--- new_string ---
/** A cell's value; for a formula cell the value Excel last computed (the original is Excel-saved, so it is there). */
private function v(Worksheet $ws, string $cell): mixed
{
    $c = $ws->getCell($cell);
    $v = $c->getValue();
    if (is_string($v) && str_starts_with($v, '=')) {
        $v = $c->getOldCalculatedValue();
        if ($v === null) {
            try {
                $v = $c->getCalculatedValue();
            } catch (Throwable) {
                $v = null;
            }
        }
    }

    return is_string($v) && trim($v) === '' ? null : $v;
}
{
    "replace_all": false
}
```

Result of Edit

The file C:\xampp\htdocs\MAICC-IFRS9\app\Services\Ebanker\TakeonLandingService.php has been updated successfully. (file state is current in your context – no need to Read it back)

Tool call: Bash

```

Take-on schedules landed, not typed; the take-on population built under its basis (spec v4 s.6.9)
```

Tamanda's workbook of 11 September 2026 is committed as received beside the mapping copy with the fee columns. TakeonLandingService reads the figures from the original (Excel-saved, so every formula carries its value) and the mapping, ticks and fees from the mapping workbook, recording the sheet and cell of every value: takeon_blocks (100 blocks) and takeon_schedule_lines (3,741 lines). Gates per block: account in the master, no account with two blocks, block principal against the take-on posting, schedule balance at 31 July 2024 against E-Banker's net opening (the 301 principal, 303 opening interest and 305 opening recovery, keyed by their operation date), dates unambiguous, serials out of order sorted and raised, a mapped facility with no fee row flagged, never assumed fee-free. A refusal is of the block and names the cell.

The build writes contract_takeon for the 78 accounts E-Banker migrated, under takeon_history_basis: recomputed from origination where the block and its fees exist, else started at the take-on balance and flagged. With no fees yet, all 78 start at the take-on balance. eir:land-takeon --build. Three tests.

Result of Bash

```
* file that disagrees raises a named exception for a human instead of
* silently invalidating the solved result and its input snapshot;
* - instrument_type is never set from the file. Whether a facility is an
* amortised loan, a preference share or excluded equity is an IAS 32/IFRS 9
* judgement (the Nascomex memo), not a product code;
* - a repayment frequency that is not recognised is reported, never guessed,
* because payments_per_year changes the solved periodic rate directly.
*
* Origination fees carried on the row (arrangement, legal) are routed to
* contract_fees as PENDING through the existing FeeImportService, so the
* maker/checker classification that gates solver readiness still applies.
* Cash direction is deliberately left unset – the sign convention on the
* delivered extracts is an open item, and a guess here would flow straight
* into the solver's net initial investment.

CLAUDE (2026-10-08 17:05:28 UTC)

I know the importers' field names now. Let me check how the demo previously drove schedules, EIR lock, GL-interest and the reconciliation so the orchestrator calls the same entry points.

Tool call: Bash

```
description: Find the demo's engine invocations and service APIs
--- command ---
cd /c:/xampp/htdocs/MAIIC-IFRS9 && grep -n "artisan\|tinker\|Service::\|->approve\|->lock\|calculate(" docs/
After_Build_Report_Demo_2026-10-08.md | head -40; echo ---; grep -n "public function" app/Services/Eir/
ScheduleWorkflowService.php app/Services/Eir/EirCalculationService.php app/Services/Eir/GLInterestImportService.php app/
Services/Eir/EirGLReconciliationService.php app/Services/Eir/TrialBalanceImportService.php | head -30
```

Result of Bash

```
3:**What this is.** On the evening of 8 October 2026 the E-Banker data of 7 and 8 October was loaded into a copy of the
MAICC-IFRS9 database (`maic_ifrs9_demo`, run with `php artisan --env=demo`) and taken as far through the existing engines as
the system allows, for the meeting with Dr Thom on 9 October. The production copy (`maic_ifrs9`) was not opened. This report
says what was built, what the system itself refused and why, how that compares section by section with specification v4, and
what the comparison teaches the build that starts on 13 October. No application code was changed; the demo used the system as
it stands on `master` at `9376fe9` plus the data.
18:| EIR | `EirCalculationService::calculate` on the 31; locked with the administrator override under the same label | 31
solved: FInES 10.47% effective annual; MAIIC Agricultural 32.9%; MAIIC Industrial 31.4%; term loans 40.9% (nominal 35%
compounded monthly) |
22:| Reconciliation | `EirGlReconciliationService::forPeriod` | Dec 2025: 116 rows, posted 286.0 m, contractual 312.6 m, 28
agree, 47 explained, 41 unexplained. Jul 2026: 49 agree, 25 explained, 28 unexplained |
23:| Tests | `php artisan test tests/Feature/Eir` | 238 passed, 24 skipped |
64:Demo scripts in `docs/build-files/`: `demo_load_loan_books.py` (method A), `demo_contract_master.py`, `demo_schemes.py`. The
database dump used for the copy is not committed. The demo database is `maic_ifrs9_demo` on the build machine; `php artisan
--env=demo serve` runs the application against it.

EirAccountingRuleSeeder.php .gitignore && git commit -q -m "$(cat <<'EOF'
eir:bootstrap: a clean install that loads itself and proves itself (spec v4 s.6.10, D26)
```

```
php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify
```

1 migrate:fresh (refused on user data without --force-wipe); 2 seed; 3 land the committed pack and the trial balances; 4 land the take-on workbook; 5 build: loan books July 2024 to August 2026 by the method in force, the take-on population, the contract master from the masters and the latest stored run, the PLR series from the PLR master, the origination fees from the LOS charges, the interest posted per account-month from the ledger (which retires Extract C), spreads, version 1 schedules approved under the bootstrap label; 6 engines, synchronously: EIR solved and locked, revenue for every period, staging, ECL for the last period, GL reconciliation; 7 verify. The fee rulebook suggests each charge's treatment and the bootstrap reviews only what a rule covers; the rulebook itself is seeded unapproved (three rules added for E-Banker's own LOS charge names) because approving it is a MAIIC decision, so contracts with unclassified fees stay blocked.

On a wiped database the run takes 80 seconds and every golden check passes: interest posted Jan 2025 to Jul 2026 of 5,293,988,207.06 from the ledger; derived carrying amounts equal to the stored report on 2,361 of 2,361 account-months; the year-end batch kontras on 4215 and 4216; the loan GLs at 31 Dec 2025 against the trial balance to the cent, with 1050201 and 1050202 off by exactly the accepted exception of section 3.5.

The clean install also found three loan_books columns the production database carries that no migration created (ead, off_balance_sheet_exposure, customer_name_imported); a guarded migration adds them.

CLAUDE (2026-10-08 17:19:07 UTC)

Reproduced: in the fresh run, revenue writes nothing even though 12 EIRs are locked. Let me capture the command's own output for one period inside that state.

Tool call: Bash

```
description: Run revenue for one period in the fresh bootstrap state
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && php artisan --env=bootstrap eir:run-revenue 2026-01 --user=1 2>&1 | head -24
{
    "timeout": 120000
}
```

Result of Bash

```

Bootstrap: stage before the revenue roll-forward, which reads the stage
```

The roll-forward puts Stage 3 interest on the net basis, so it refuses a period whose stage is missing. The chain now stages every period first, then solves and locks the EIR and runs revenue, then the ECL. The revenue step reports the roll-forward rows it wrote from the table itself.

```

/**
 * The EIR computation for any loan as at any date the user names (spec v4
 * section 6.11), and the same for the whole book.
 *
 * A month-end reads the roll-forward row the revenue run locked for that
 * month. A date inside a month takes the prior month-end's closing amortised
 * cost and accrues the EIR for the actual days over 365, less the cash the
 * ledger shows received in between. The gross carrying amount at the date is
 * the ledger's running balance. The contractual interest is what the ledger
 * posted (types 303 and 120). A date in a locked period reproduces the locked
 * figures, because the roll-forward rows are what was locked; a date after
 * the last loaded posting is refused with that date named, never estimated.
 * Every figure is returned with the inputs that produced it.

-q -m "$(cat <<'EOF'
The EIR as at any date (spec v4 s.6.11); the ledger's cash movements feed the roll-forward (s.7.1)
```

EirAsAtService: for a loan and a date, the EIR in force and when it was solved and locked, the amortised cost (the locked roll-forward row at a month-end; inside a month the prior month-end closing accrued at the EIR on the actual days over 365 less the cash received), the gross carrying amount as the ledger's running balance, the EIR and contractual interest to the date in the period and the year, the cumulative difference, the remaining expected cash flows under the schedule version in force, the modification and solve history, and the inputs each figure came from. A date after the last loaded posting is refused with that date named. The book view rolls the year-to-date difference (the revenue shift) up by product, by GL and in total. eir:as-at {date} [--contract=] [--json].

The bootstrap now loads the ledger's receipts, reversals and disbursements as the actual transactions the revenue roll-forward prefers over the schedule, keyed by voucher id: 107 of 138 roll-forward months on the clean install take their cash from the ledger.

CLAUDE (2026-10-08 17:30:14 UTC)

Now the user-facing side: the suite layout (section 11) with the feed screen (6.8) and the take-on screen (6.9). Reading the spec's section 11 and what the reference layout looks like.

Tool call: Bash

description: Read spec section 11 (suite UI)

```
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && awk '/^## 11\. /,/^## 12\. /' docs/MAIIC_EIR_Engine_Specification_v4_2026-10-07.md | head -120
```

Result of Bash

11. The user interface: the Dupleix-suite layout

11.1 In plain language

Every system Dupleix now delivers uses the same shape of screen, the Dupleix suite layout, so that a finance officer who has learned one of them can find their way around the next. MAIIC's system was built earlier, and its menu still follows the headings of the contract schedule ("Customer & Loan Data", "IFRS 9 Model Setup", "ECL Processing") rather than the way the work is actually done. Decision D24 adopts the suite layout for MAIIC.

The shape is simple. On the left is a dark navigation panel with six working groups, each with its own colour: **Data Foundation** (what comes in), **Governance Centre** (the rules and settings that govern the calculations), **Financial Modelling** (the engines), **Risk & Regulatory** (the regulatory views), **Monitoring** (the watch-lists and alerts) and the **Report Hub** (what goes out), followed by System Documentation and Administration. Across the top is a bar with the menu toggle, the financial period the system is working in, an appearance switch (light, dark, or follow the device), notifications and the user's menu. Every page opens with a header that says where you are (the group, then the page) and what the page is for. The panel can be folded to a narrow rail of icons when the screen is small or the user wants room for a wide table. Nothing about the calculations changes; the screens move to where a user would look for them.

11.2 What the layout is made of

| Element | What it does | Source |
|----------------------------|---|--------|
| Navigation panel (sidebar) | The brand at the top, then the two top-level links (Dashboard, Workspace), then the groups. One group is open at a time; the group that contains the current page opens by itself. Each group has an icon tile in its own colour, and the page in use is marked with a bar in that colour. The suite's sidebar; MAIIC keeps its own recursive renderer so that a group can hold sub-groups (the modelling group needs them) | |
| Icon rail | The hamburger in the top bar folds the panel to 68 pixels of icons; the choice is remembered in the browser. On a phone the same button opens the panel as a drawer over the page. The suite's shell | |
| Top bar | Menu toggle; a chip showing the financial period the system is working in and whether it is open or closed; the appearance switch (11.5); the notification bell; the user menu (profile, API tokens, log out). The decorative search box that does nothing today is removed. The suite's top bar | |
| Page header | An icon tile, the breadcrumb (group, then page) derived from the navigation tree and the current route, the page title, a one-line description, and a slot on the right for the page's actions. A page that already supplies its own header keeps it, inside this frame. The suite's shell | |
| Processing pill | The floating "Processing" and "Done" indicator while a request is in flight. Already in MAIIC; unchanged. Already in MAIIC | |
| Fail-loud error dialogue | The plain-language explanation of a 403, 419, 404 or server error. Already in MAIIC; unchanged. MAIIC | |
| Per-page help | MAIIC's help centre and the Help button on every page stay as they are. The guide text that names menu groups is re-worded to the new groups. MAIIC | |

Everything in the suite's shell is adopted, including light and dark mode (11.5). MAIIC's pages were not written with a dark variant, so the dark mode is delivered in two steps: the shell and the shared styles first, then a sweep of the pages (11.9).

11.3 Where every screen lives

The tree is the single source of truth: the server holds it in `config/menu.php`, filters it by the user's permissions, and sends it to the browser, which renders the panel and derives the breadcrumb from it. Nothing is duplicated in the Vue code. Routes do not change; only the grouping, the group names and the order do. "Today" is the group each screen sits in now.

| Group (colour) | Screen | Route | Permission | Today |
|----------------------------------|--|--|------------|---|
| Top level | Dashboard | <code>`dashboard`</code> | | same |
| Top level | Workspace | <code>`workspace.index`</code> | | same |
| Data Foundation (teal) | Clients | <code>`clients.index`</code> | | Customer & Loan Data |
| | Loan Book | <code>`loan_applications.loan-book`</code> | | Customer & Loan Data |

| System Documentation (slate) | User Manual, Administrator Manual, Technical Manual, Installation Guide | `help.index`,
`help.admin`, `docs.technical`, `docs.installation` | | same |
| Administration (rose) | User Management, Roles & Permissions, Support Tickets, Settings | `users.index`, `users.roles.index`,
`tickets.index`, `settings.index` | | same, less the two that moved to Governance |
```

Three rules behind the placement. A screen that **captures or shows what came in** is Data Foundation, whichever module uses it, so the EIR's data, drawdowns and reference rates sit beside the loan book and the collateral. A screen that **sets a rule the engines obey** is Governance Centre: the EIR settings, the accounting and fee rules, the staging thresholds, the periods and the audit trail that proves who changed what. A screen that **produces a figure** is Financial Modelling; one that **re-presents figures for a regulator or a reader** is Risk & Regulatory or the Report Hub. The hub's catalogue of 30 reports is unchanged; the eleven listed above are also reachable from the panel because they are the ones used weekly.

11.4 Behaviour, stated precisely

- **Permissions.** The server drops any entry whose permission the user lacks, and any group left empty, before the tree is sent (`HandleInertiaRequests::visibleMenu`, unchanged). A user never sees a link that would answer 403.
- **Active state.** An entry is active when the current route name equals its route (or its `route_check`). The group containing the active entry is open on page load and its header carries the group colour; one group is open at a time; the user may open another, which closes the first.
- **Breadcrumb.** Derived on the client from the tree and `route_name`: top-level entries give one crumb; a grouped entry gives group, then page; a sub-grouped entry gives group, sub-group, then page. A page outside the tree (an edit form reached from a list, for example) shows the crumb of the nearest list by its `route_check`.
- **Collapse.** Stored in the browser as `maic.sidebar.collapsed`; on a screen narrower than 768 pixels the toggle opens the drawer instead. In the rail, each group shows its icon tile and, under it, the icons of its leaves with the label as a tooltip; sub-groups are flattened into their parent's icons.
- **Period chip.** The top bar shows the latest financial period and "Open" or "Closed" from its `closed` flag, shared from the server as `currentPeriod`. It is a display; it does not change the period.
- **Page header.** `title` and `description` may be passed as props; otherwise the title is the active entry's name and the description is empty. The `#header` slot, where a page provides one, renders inside the header frame in place of the derived title; the `#actions` slot renders on the right.
- **Colours.** Group colours are Tailwind families (teal, amber, sky, indigo, emerald, violet, slate, rose) written in full in one accent map so that the build includes them. The brand remains MAIIC navy and gold on the dark gradient.

11.5 Light and dark mode

Every user chooses how the system looks, and the choice follows them.

- **Three settings.** Light, Dark, and Follow the device. The switch is in the top bar and cycles through the three; the same choice is on the user's profile page. The default for a new user is Follow the device.
- **How it is applied.** Tailwind runs in class mode (`darkMode: 'class'`): the whole system is dark when the `dark` class is on the `<html>` element and light when it is not. Nothing else decides the theme, so there is one switch to test.
- **No flash of the wrong theme.** A four-line script in `app.blade.php` runs before the page paints: it reads the saved choice from the browser (`maic.theme`), falls back to the device setting when the choice is Follow the device or absent, and sets the class. The Vue code then mirrors that state in one shared composable (`useTheme`) so the top-bar switch, the profile page and any other consumer stay in step.
- **Where the choice is kept.** In the browser, so that the first paint is right, and on the user's record (`users.theme_preference`, values `light`, `dark`, `system`), so that it follows the user to another machine: on login the server's value is written to the browser; when the user changes it, the browser value is written and the server is told. If the browser's storage is unavailable, the theme still applies for the session.
- **What dark mode must look like.** The sidebar keeps its dark gradient in both modes (it is dark by design). The page background, cards, tables, inputs, buttons, badges, modals, charts and the help panels carry a dark variant: slate backgrounds, light text, the group colours unchanged, MAIIC gold kept for the active marks. Contrast meets WCAG AA in both modes; no screen may show light text on a light ground or dark on dark.
- **How the pages get there without rewriting 281 components.** The shared classes the pages already use (`.card`, `.th`, `.td`, `.primary-btn`, `.secondary-btn`, the form inputs, the badges, the flash messages) are given their dark variant once in `app.css`, so most pages inherit the theme. The pages that style elements directly are then swept one group at a time (11.9), each page checked in both modes before it is signed off. Printed and exported outputs (PDF, Excel) are always rendered in the light palette, whatever the screen shows.

11.6 What changes in the code, and what does not

```
| Change | Where |
|---|---|
| The tree regrouped as in 11.3, with an `accent` key on every group | `config/menu.php` |
| Accent map and group colours in the renderer; icon-rail mode | `resources/js/Jetstream/DropdownMenu.vue`, `SidebarNav.vue`, a new `resources/js/navAccents.js` |
| Collapse state, drawer, page header with breadcrumb, period chip; the dummy search removed; the dead consultation-channel
```

```
code removed | `resources/js/Layouts/AppLayout.vue` |  
| `currentPeriod` and the user's `theme_preference` shared with every page | `app/Http/Middleware/HandleInertiaRequests.php` |  
| Tailwind in class mode; the no-flash script; the `useTheme` composable; the top-bar switch; the profile setting and its  
endpoint; `users.theme_preference` | `tailwind.config.js`, `resources/views/app.blade.php`, `resources/js/composables/  
useTheme.js`, `AppLayout.vue`, the profile page, one migration and `ProfileController` |  
| Dark variants of the shared classes, then of the pages that style directly, group by group | `resources/css/app.css`, then  
the page components under `resources/js/Pages` |  
| Help-centre guides that name a group (fifteen passages) re-worded | `database/seaders/data/help_user_content`,  
`help_admin_content` |  
| User and Administrator manuals: navigation chapter re-written and screenshots retaken | `docs/manuals` |  
| A test that every leaf in the tree names a registered route and that every group has an accent | `tests/Feature/  
NavigationTest.php` (new); `SystemDocsTest` unchanged |
```

Not changed: any route, controller, page component, permission or calculation. The three icons the groups need and MAIIC does not yet register (shield, bell, balance-scale) are added to the Font Awesome library.

11.7 Acceptance

1. Every entry in 11.3 is reachable from the panel by a user with the right permission, and absent for one without it.

/*
|-----
| MAIIC IFRS 9 - contract-aligned navigation
|-----
| Groups mirror the Schedule 1 solution components of the MAIIC-Dupleix
| implementation agreement (data onboarding, collateral, EIR, IFRS 9 model
| setup, ECL engine, reports, audit trail, dashboard, administration).
|
| Duplication rules applied (nav audit, Aug 2026):
| - The four report/export screens that lived under "Customer & Loan Data"
|   (Disbursements, Loan Book Reconciliation, Loan Book Export, ECL Export)
|   are reports - they live under Reports, next to the hub.
| - ECL Reconciliation (the richest reconciliation page) is surfaced; it was
|   previously reachable only through the hidden legacy /report hub.
| - The EIR trio (Accounting Rules -> Schedule Intake -> Fee Classification)
|   is one pipeline and sits together in one group.
| - Early Warning System & AI Executive Commentary are tiles INSIDE the
|   IFRS 9 Reports hub - they are not duplicated as menu items.
| - Regression Analysis is forward-looking model fitting; it lives under
|   the Forward-Looking Model group, not a separate Analytics group.
| - The IFRS 9 Reports hub contains the full 30-report catalogue (incl. the
|   Sensitivity/stress tile); the standalone Stress Testing page is the
```

```

|   loan-level engine and is kept as a separate Reports entry.
|
| The sidebar renderer (Jetstream/DropdownMenu.vue) is recursive with
| accordion behaviour, so groups may nest. Every leaf points to a real
| registered route. The legacy /report (reports.index) is intentionally
| NOT linked.
*/

// $download=true => the route returns a file (e.g. PDF). The sidebar must
// render it as a plain <a>, not an Inertia <Link>, or the SPA hangs trying
// to parse the binary as an Inertia response.
// $permission hides the leaf from users who lack it (HandleInertiaRequests
// filters the menu); it must match the permission the route's controller
// enforces, or a user sees a link that answers 403.
$leaf = fn ($name, $route, $icon = 'circle', $download = false, $permission = '') => [
  'name' => $name, 'icon' => $icon, 'route' => $route, 'route_check' => $route,
  'permissions' => $permission, 'dropdown' => false, 'children' => [], 'order' => 0,
  'download' => $download,
];
$group = fn ($name, $icon, $children, $order) => [
  'name' => $name, 'icon' => $icon, 'route' => '', 'permissions' => '',
  'dropdown' => true, 'children' => $children, 'order' => $order,
];

return [
  'admin' => [

    [

--- content ---

<?php

```

/*
|-----
| MAIIC IFRS 9 - the Dupleix-suite navigation (spec v4 section 11, D24)
|-----
| Six working groups, each with its own colour, in the order a finance
| officer does the work: what comes in (Data Foundation), the rules the
| engines obey (Governance Centre), the engines (Financial Modelling), the
| regulatory views (Risk & Regulatory), the watch-lists (Monitoring) and
| what goes out (Report Hub), then System Documentation and Administration.
|
| Three rules behind the placement (spec 11.3): a screen that captures or
| shows what came in is Data Foundation, whichever module uses it; a screen
| that sets a rule the engines obey is Governance Centre; a screen that
| produces a figure is Financial Modelling, and one that re-presents figures
| for a regulator or a reader is Risk & Regulatory or the Report Hub.
|
| The tree is the single source of truth: HandleInertiaRequests filters it
| by the user's permissions and sends it to the browser, which renders the
| panel and derives the breadcrumb from it. Routes do not change; only the
| grouping does. Every leaf names a registered route (tests/Feature/
| NavigationTest). Every group carries an accent, one of the Tailwind
| families written in full in resources/js/navAccents.js.
*/

// $download=true => the route returns a file; the sidebar renders a plain <a>.

```
<?php

/*
|-----
| MAIIC IFRS 9 - the Dupleix-suite navigation (spec v4 section 11, D24)
|-----
| Six working groups, each with its own colour, in the order a finance
| officer does the work: what comes in (Data Foundation), the rules the
| engines obey (Governance Centre), the engines (Financial Modelling), the
| regulatory views (Risk & Regulatory), the watch-lists (Monitoring) and
| what goes out (Report Hub), then System Documentation and Administration.
|
| Three rules behind the placement (spec 11.3): a screen that captures or
| shows what came in is Data Foundation, whichever module uses it; a screen
| that sets a rule the engines obey is Governance Centre; a screen that
| produces a figure is Financial Modelling, and one that re-presents figures
| for a regulator or a reader is Risk & Regulatory or the Report Hub.
|
| The tree is the single source of truth: HandleInertiaRequests filters it
| by the user's permissions and sends it to the browser, which renders the
| panel and derives the breadcrumb from it. Routes do not change; only the
| grouping does. Every leaf names a registered route (tests/Feature/
| NavigationTest). Every group carries an accent, one of the Tailwind
| families written in full in resources/js/navAccents.js.
*/

// $download=true => the route returns a file; the sidebar renders a plain <a>.

The Dupleix-suite layout with light and dark mode; the feed, take-on and as-at screens (spec v4 s.11, 6.8, 6.9, 6.11; D24)
```

config/menu.php regrouped into the six working groups, each with its accent, plus System Documentation and Administration; the tree carries a one-line description per screen and is the single source of truth. The sidebar renders the group colours and folds to a 68px icon rail (remembered in the browser; a drawer on a phone). The top bar carries the menu toggle, the financial-period chip, the appearance switch (light, dark, follow the device), the bell and the user menu; the decorative search box and the dead consultation-channel code are gone. Every page opens with a header: icon tile in the group colour, breadcrumb derived from the tree and the route, title, description, actions slot. Tailwind runs in class mode; a four-line script sets the theme before paint; useTheme keeps the switch, the profile and the server (users.theme_preference, profile.theme) in step; the shared classes carry their dark variant in app.css.

Three new screens: Data Foundation / E-Banker Feed (route in force, method in force, loads with gate results and accepted exceptions, watermarks, land a pack by route 1, propose and approve a build, periods built, the query register, the queries as a file); Data Foundation / Take-on Schedules (the workbook, every block with mapping, confidence, tick, fees, gates and cells, confirm a mapping or enter fees on the screen with the audit log, the take-on population and its basis); Report Hub / EIR as at a Date (the book by product and GL with the revenue shift, one contract's full computation, the year-end shortcuts, the CSV). NavigationTest proves every leaf names a registered route and every group has an accent.

### 13.1 In plain language
### 13.2 What MAIIC has today
### 13.3 What the suite does, and is adopted
### 13.4 The Malawi series, seeded
### 13.5 Behaviour, stated precisely
- **Country.** `MWI` by default; the screen may fetch another country for comparison, and such rows carry their country and are never used by the FLI model.
- **Periods.** World Bank and WEO series are annual; MAIIC's FLI model runs on the frequency the series definition states. An annual value is held as the year's observation; the Weighted Forecast interpolates to quarters or months as it does today, and says so on the row.
- **Actual against forecast.** A World Bank value is an actual. A WEO value is an actual up to the estimates-start year and a forecast after it; a later WEO vintage replaces an earlier forecast and the earlier one is kept in the batch history. A forecast is never overwritten by hand without a reason.
- **Precedence** (`macro_source_precedence`, section 4.2): World Bank for actuals, IMF WEO for forecasts, the RBM file for rates; a manual entry overrides any of them only with a reason, and the override is shown on the row and in the audit log.
- **Failure.** A series the source cannot supply is reported on the preview and skipped on the command; the import never fails as a whole because one indicator is missing. A fetch that cannot reach the source after the retries says so and leaves the table as it was.
- **Provenance to the audit workbook.** The IFRS 9 impairment workbook of section 12 cites, for B5.5.49 to B5.5.54, the batch behind each series in use: source, address, fetched-at, who committed it.
### 13.6 What changes in the code
### 13.7 Acceptance
### 13.8 Order of work

13.3 What the suite does, and is adopted

```
| Element | What it does | MAIIC adoption |
|---|---|---|
| **Indicator codes on the series** | Each macro variable carries the external codes that identify it at each source
('external_codes', for example '{"world_bank": "NY.GDP.MKTP.KD.ZG"}'), seeded once. A series with no code says so on the screen;
it is not an error | Two columns added to 'macro_statistics': 'external_codes' (JSON) and 'country' (ISO3, default 'MWI'); a
seeder with the Malawi codes of 13.4 |
| **World Bank fetcher** | Pulls an annual series for a country from 'api.worldbank.org/v2/country/{ISO3}/indicator/{code}':
public, no key, 60-second timeout, two retries, year range optional, country from configuration with a screen override. Returns
a normalised preview; writes nothing | 'WorldBankFetcherService' ported as it is; 'services.worldbank.country = MWI' |
| **IMF WEO parser** | Reads the World Economic Outlook download (a tab-delimited UTF-16 text file despite its '.xls' name),
filters to the country and indicator, and marks each year actual or forecast from the "Estimates Start After" column. This is
where the forecast periods come from | 'ImfWeoParserService' ported; the file is uploaded by hand from the IMF site, which has
no key-free API |
| **Preview, then commit** | Two endpoints per source: a preview the viewer may call, and a commit that writes, for the manager
only. Nothing reaches the table until a person has seen the rows | Routes 'macro-statistics.preview-worldbank',
'.import-worldbank', '.preview-imf-weo', '.import-imf-weo'; permissions 'macro.view' and 'macro.manage' added to the role set |
| **Provenance per import** | Every commit is a batch: source, address, fetched-at, who, how many rows, the file's hash where
there is one; every observation points to its batch | 'macro_source_import_batches'; 'source_import_batch_id' on
'macro_statistics_data'; the free-text 'source' kept for manual entries |
| **Upsert, never duplicate** | Observations are keyed on series, period and period type, so a refresh updates the value and
keeps the key | MAIIC's unique key on series, period and scenario already does this; an API import writes to the base scenario |
| **A command** | 'macro:import-worldbank {--code=}' imports every series with a code, non-fatal per series, for the bootstrap
and the scheduler | The same command; run by 'eir:bootstrap' and monthly by the scheduler; a committed JSON snapshot under
'docs/bootstrap/macro/' is the offline fallback so a server without internet still bootstraps |
| **The screen** | One page with five tabs: Dashboard, Variables, Data Entry, governed assumptions, Import / Export (World Bank
with country and year range, IMF upload, CSV template and export) | Data Foundation, Macro Statistics (section 11.3), five tabs;
the governed-assumptions tab is **Scenario Assumptions**, the base, mild and severe paths that feed Scenario Profiles and the
Weighted Forecast, with the same approval lineage |
```

Two things the suite does not have are added for MAIIC. **Reserve Bank of Malawi series by file**: the policy rate and the prime lending rate are not on the World Bank; the PLR is already in the landing zone ('P2_06') and the policy rate arrives as a small CSV through the same preview-and-commit screen, one more source tab rather than a special case. **A rule for disagreement**: a Governance Centre setting, 'macro_source_precedence', says which source wins where two overlap.

13.4 The Malawi series, seeded

```
| Code | Series | World Bank indicator | Why MAIIC needs it |
|---|---|---|---|
| GDP_GROWTH | Real GDP growth, annual % | 'NY.GDP.MKTP.KD.ZG' | The headline driver of default rates |
| CPI | Inflation, consumer prices, annual % | 'FP.CPI.TOTL.ZG' | Real income of borrowers; the policy-rate path |
| MWK_USD | Official exchange rate, MWK per USD | 'PA.NUS.FCRF' | Import-dependent borrowers; the industrial book |
| LENDING_RATE | Lending interest rate, % | 'FR.INR.LEND' | Debt service burden; cross-check to the PLR series |
| REAL_RATE | Real interest rate, % | 'FR.INR.RINR' | Affordability after inflation |
| PRIVATE_CREDIT | Domestic credit to private sector, % of GDP | 'FS.AST.PRVT.GD.ZS' | Credit conditions |
| AGRI_GROWTH | Agriculture, forestry and fishing value added, annual growth % | 'NV.AGR.TOTL.KD.ZG' | MAIIC's book is
agricultural and agro-industrial; the harvest is its own driver |
| BROAD_MONEY | Broad money growth, annual % | 'FM.LBL.BMNY.ZG' | Liquidity conditions |
| RESERVES | Total reserves in months of imports | 'FI.RES.TOTL.MO' | Exchange-rate and import-cover stress |
| DEBT_GDP | Central government debt, % of GDP | 'GC.DOD.TOTL.GD.ZS' | Sovereign stress and crowding out |
| CURRENT_ACCOUNT | Current account balance, % of GDP | 'BN.CAB.XOKA.GD.ZS' | External balance |
| POLICY_RATE | RBM policy rate, % | by file (RBM) | The rate the PLR follows |
| PLR | Prime lending rate, % | the landing zone, 'P2_06' | The floating-rate reference of the EIR engine, so the ECL and EIR
modules read one series |
```

The IMF WEO gives the forecast years for GDP growth, inflation, the current account and government debt; the World Bank gives the actuals. A code that the World Bank later retires is a seeder change, not a code change.

13.5 Behaviour, stated precisely

```

```

Each macro series carries the codes that identify it at each source and its country; thirteen Malawi series are seeded (eleven with a World Bank indicator, the RBM policy rate by file, the PLR from the landing zone). WorldBankFetcherService, ported from the suite, pulls an annual series and returns a preview; MacroImportService commits it as a batch (source, address, fetched-at, who, rows) with every observation pointing to its batch, keyed on series, period and the base scenario so a refresh updates in place. macro:import-worldbank imports every coded series, non-fatal per series, falls back to the committed snapshot when the source cannot be reached, and writes the snapshot after a live fetch. The bootstrap runs it as engine step 1. Today's live fetch: 261 observations, 2000 to 2025.

CLAUDE (2026-10-08 17:47:30 UTC)

The engines rely on support classes (Stats, SeriesAligner, AdjustmentMethods, ExpectedSignPolicy, GovernedValues) that the reference folder doesn't hold. Looking for the FDH repo locally.

Tool call: Bash

description: Look for the FDH repo and its FLI support classes

```
--- command ---
ls /c/xampp/htdocs/ | head -20; for d in /c/xampp/htdocs/*/app/Support/Fli; do [ -d "$d" ] && echo "FOUND $d" && ls "$d"; done
2>/dev/null
```

14.7 How the adjustment reaches the PD: the transmission method

The route of 14.6 says where the adjustment comes from. The transmission method says how it moves a loan's PD once it exists. MAIIC has one method today, the multiplicative scalar; it is kept as the default, and the alternatives are built as governed choices with the data each one needs, so that the method can change when the history can support it without a change to the code.

****What the scalar does, and what it implies.**** The adjustment is a ratio to the base period (predicted proxy in the window over predicted proxy today, less one), and the loan's PD is multiplied by one plus that ratio. It is proportional, the same for every loan whatever its starting PD, and linear in the macro variable. Real credit risk is neither: a downturn moves weak borrowers far more than strong ones, and loss rates accelerate as conditions worsen. The first effect is why the cap at 100 percent is needed at all; the second is recovered at the scenario level by weighting the ECL across scenarios (15.5) even though the transmission inside each scenario stays linear. With two years of core-banking history, the scalar is the honest choice: the richer methods below need a default-rate series the institution does not yet have.

****The governed setting**, `fli\_transmission\_method`, with the preconditions the guardrail checks before a method may run. A method whose preconditions are not met is declined with the reason and the PD holds, exactly as a failed fit is declined.**

```
| Method | Transmission | Needs | Status |
|---|---|---|---|
| **Multiplicative scalar on the proxy ratio** (seeded) | post-FLI PD = pre-FLI PD × (1 + adjustment); the adjustment is
predicted proxy(window) / predicted proxy(base) - 1 | An approved fit, or an overlay | MAIIC's method; kept |
| Segment-specific scalar | The same, with one fit and one adjustment per portfolio or product group, from the segment proxies
the deriver produces | A derivable proxy per segment (two or more periods each) | The natural next step; the deriver of 14.4
makes it possible |
| The nine reference methods | The suite's governed producers of a factor from a fit crossed with the scenario-weighted driver:
the weighted statistic; the annual difference and the annual change in the driver; both scaled by the correlation; the absolute
PD forecast from the equation; the forecast-over-base ratio (MAIIC's scalar is this one); and the two correlation-scaled
difference and change variants | An approved fit with slope, intercept and correlation; the scenario-weighted driver | Ported
as they are; selectable one at a time; each returns nothing rather than a fabricated figure when an input is undefined |
| Logit-linear PD model |  $\text{logit}(\text{PD}) = \alpha + \beta \times \text{macro}$ ; the move is in log-odds, so proportional in the odds rather than the
probability and bounded by construction | A grade-level or loan-level default series long enough to fit (the guardrail's
minimum observations, at the grade level) | Available when the history allows; declined until then |
| Vasicek single-factor Z-shift | The through-the-cycle PD is moved through the latent systematic factor:  $\text{PIT PD} = \Phi[(\Phi^{-1}(\text{TTC PD}) - \sqrt{\rho} \times Z) / \sqrt{(1 - \rho)}]$ , with Z from the macro fit and  $\rho$  governed; the shift is largest for mid-range PDs and bounded by
construction | A governed asset correlation  $\rho$  per portfolio and a Z series calibrated on a default-rate history | Available
when the history allows; declined until then |
```

Whichever method is in force, three things do not change: Stage 3 is 100 percent; Stage 1 takes the 12-month window and Stage 2 the lifetime window; and the result is floored at 0 and capped at 100 percent. The method runs once per scenario under the weighting of 15.5, and the loan row records the method beside the route (14.8), so two loans adjusted under different methods in different periods can both be explained.

****The system explains each method, in the screen, not only in this document.**** On the FLI Adjustments screen and beside the setting in the Governance Centre, every method has a ****method card**** with the same five parts: what it does, in two or three plain sentences a finance officer can read; the formula, written out with its symbols named; what it implies (proportional or not, bounded or not, linear or not, which loans it moves most); its ****preconditions**, checked live against MAIIC's data** at the moment the card is opened, each shown as met or not met with the figure that decides it ("default-rate series: 24 months held, 36 needed"; "asset correlation: not yet governed"); and a ****worked example**** on one real loan of the book, showing the pre-FLI PD, the inputs, the arithmetic and the post-FLI PD under that method. A method whose preconditions are not met cannot be selected, and the card says exactly what has to be true before it can be. The same cards are reproduced in the help centre and in the impairment audit workbook, so that the choice of method is explained in the same words to the user, the Board and the auditor. The texts are seeded content, versioned like the help articles, not strings in the code.

****Switching.**** A change of method is a governed change with an effective date, under maker-checker, like every other setting. The first period run under a new method shows the ECL under both methods and the difference, which is itself a disclosure the auditors will want, as it is for the scenario weighting.

14.8 Lineage on the loan

/**
 * How a forward-looking adjustment reaches a loan's PD (spec v4 section
 * 14.7): the governed transmission methods, each with a method card the
 * system explains in the screen, in the Governance Centre, in the help
 * centre and in the audit workbook, in the same words.
 *
 * A card has five parts: what the method does in plain language; the
 * formula with its symbols named; what it implies; its preconditions,
 * checked live against MAIIC's data with the figure that decides each; and
 * a worked example on one real loan of the book. A method whose
 * preconditions are not met cannot be selected, and the card says what has
 * to be true before it can be. Whichever method is in force: Stage 3 is
 * 100 percent, Stage 1 takes the 12-month window and Stage 2 the lifetime
 * window, and the result is floored at 0 and capped at 100 percent.

[32mMultiplicative scalar on the proxy ratio [in force] [seeded default] [preconditions not met][39m
The adjustment is the ratio of the predicted credit-loss proxy in the forecast window to the predicted proxy today, less one. Every loan's PD is multiplied by one plus that ratio. It is MAIIC's method today and the seeded default: with two years of core-banking history it is the honest choice, because the richer methods need a default-rate series the institution does not yet have.
Formula: post-FLI PD = pre-FLI PD × (1 + a), where a = proxy(window) / proxy(base) - 1
- Proportional: the same percentage move for every loan whatever its starting PD
- Linear in the macro variable
- Not bounded by construction: the cap at 100 percent does the bounding
- Moves weak and strong borrowers alike, which real downturns do not
[not met] An approved fit (slope, intercept, correlation), or an overlay: no approved fit and no overlay

[32mSegment-specific scalar [preconditions not met][39m
The same arithmetic as the scalar, with one fit and one adjustment per portfolio or product group, from the segment proxies the deriver produces. A downturn then moves the agricultural book by its own history and the industrial book by its own.
Formula: post-FLI PD = pre-FLI PD × (1 + a_s), where a_s = proxy_s(window) / proxy_s(base) - 1 for the loan's segment s
- Proportional within a segment, different between segments
- Needs a derivable proxy per segment: two or more staged periods each
- The natural next step once the deriver of section 14.4 has segment history
[not met] An approved fit (slope, intercept, correlation), or an overlay: no approved fit and no overlay
[not met] A derivable proxy per segment (two or more staged periods each): 6 of 0 segments have two or more periods

[32mOne of the nine reference methods [preconditions not met][39m

Support && git commit -q -m "$(cat <<'EOF'
The transmission methods, each explained with its preconditions checked live (spec v4 s.14.7)
```

TransmissionMethodCatalogue: the five governed methods of fli_transmission_method (the multiplicative scalar, seeded; the segment scalar; the nine reference methods, ported as they are from the suite in App\Support\Fli; the logit-linear model; the Vasicek Z-shift) with apply() for one loan's PD, floored at 0 and capped at 1, declining rather than inventing when an input is undefined. Each method has a card with the same five parts: what it does in plain language, the formula with its symbols named, what it implies, its preconditions checked against MAIIC's data with the figure that decides each ("default-rate series: 26 months held, 36 needed"; "asset correlation: not yet governed"), and a worked example on one real loan. A method whose preconditions are not met cannot be selected. fli:method-cards on the console; /fli/transmission-methods as JSON for the screens. The FDH support classes the reference engines need are now in docs/reference so the reference logic is complete. Four tests.

Result of Bash

9.8 Loading E-Banker directly (interim, from 8 October 2026)

From October 2026 the three extract scripts of 9.5 are no longer the source. The system is loaded from the E-Banker tables themselves, pulled by the queries kept under `docs/bootstrap/queries/` and committed as CSV under `docs/bootstrap/`. Until the landing zone and `eir:bootstrap` of specification v4 section 6 are built, the load is the sequence below, which is what was run on the demo database on 8 October 2026 (see `docs/After\_Build\_Report\_Demo\_2026-10-08.md`). Run it against a copy first.

1. **Migrate and seed.** ``php artisan migrate --force``, then ``php artisan db:seed --class=GovernanceSettingsSeeder``. The seeder adds only keys that do not exist, so an approved MAIIC change is never overwritten.
2. **Loan books from the stored report runs.** ``docs/build-files/demo_load_loan_books.py`` reads ``P2_08_loan_book_history.csv`` (and ``M09_03`` for the latest month when present), keeps the latest run per account and month-end, and upserts ``loan_books`` on ``(contract_id, reporting_period)``, touching only the loan-book columns. Contract ids are stored without leading zeros, as the Excel importer has always stored them. Set the target database at the top of the script.
3. **Trial balances.** ``php artisan eir:import-trial-balances "<folder of Trial Balance_*.xls>" --afs="<AFS bridge workbook>"``. The December 2025 income accounts come from the AFS bridge's sheet "Final E-Banker TB Dec 2025" (the 10 September 2026 version; the 19 August version holds its amounts as text).
4. **Scheme settings.** ``docs/build-files/demo_schemes.py`` loads the 18 schemes of ``DD_10_scheme_settings.csv`` into ``schemes`` (interest policy, floating flag, interest basis, EMI type) and adds the payment frequency to the contract-master file. The instalment basis and the moratorium type are not asserted: DD_10 holds them as codes that the vendor has not yet read for us, and the schedule generator refuses the contracts that need them rather than guessing.
5. **Contract master.** ``docs/build-files/demo_contract_master.py`` builds a file from ``P1_02`` and ``P1_03`` and the latest loan-book row with the headers the importer accepts; load it on the EIR Data intake screen as import type contract master, or through ``MappedFileReader`` and ``ContractMasterImportService``. A contract with no loan-book row since December 2024 is held, by design.
6. **Reference rates and spreads.** ``php artisan eir:import-reference-rates <PLR csv> --user=<id>`` then ``php artisan eir:derive-spreads``.
7. **Schedules and EIRs.** ``php artisan eir:generate-schedules --dry-run`` lists what is ready and why the rest is not; without ``--dry-run`` it writes the drafts. Approval and the EIR lock are maker-checker actions on the screens; a bootstrap on a clean copy may approve them under the label "System Bootstrap (automated data-readiness, not a MAIIC approval)", and must say so wherever the figures are shown.
8. **GL interest.** Load Extract C (or the ledger's type 303 and 120 postings in the same shape) as import type gl interest. The importer refuses duplicate runs and annual rows; the kept total for January 2025 to July 2026 is 5,293,988,207.06.
9. **Revenue and reconciliation.** ``php artisan eir:run-revenue <YYYY-MM> --user=<id>`` for each period, then the GL Reconciliation screen. A contract is refused until its EIR is locked and the period has a loan-book row with a stage.

What this interim sequence does not do, and the specification's section 6 build will: land the raw tables with their hashes, run the pack gates, read the arrears buckets and the overdue date from the stored report into the staging classifier under the header names it expects (``1_30_days`` to ``271_360_days``), counting days past due from ``OVERDUE_PRINCI_DATE`` rather than from ``OVERDUE_PERIOD``, which is in months (``docs/build-files/demo_stage.py`` does this for the interim load), load the ledger as actual transactions so that cash is not taken from the schedule, and run the whole sequence as one command with the baselines verified at the end.

Shell cwd was reset to `c:\xampp\htdocs\Stress-Testing-App`

CLAUDE (2026-10-08 17:52:10 UTC)

Replacing the interim section 9.8 with the built procedure.

Tool call: Bash

description: Rewrite installation guide section 9.8 with the built procedure

```
--- command ---
cd /c/xampp/htdocs/MAICC-IFRS9 && PYTHONIOENCODING=utf-8 python - <<'PYEOF'
p = "docs/manuals/installation/09-data-loading.md"; s = open(p, encoding="utf-8").read()
i = s.index("### 9.8 Loading E-Banker directly")
new = "#### 9.8 Loading from E-Banker: the landing zone and the bootstrap (from 8 October 2026)
```

From October 2026 the three extract scripts of 9.5 are no longer the source. The system is loaded from the E-Banker tables themselves, pulled by the queries kept under `docs/bootstrap/queries/` and committed as CSV under `docs/bootstrap/` with `manifest.json` (every file's query id, row count and SHA-256, and the accepted exceptions). Specification v4 section 6 describes the design; this section is the procedure.

****One command on a clean database.****

```
...
php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify
...

| Step | What it does | Command on its own |
|---|---|---|
| 1 | `migrate:fresh`; refused if the database holds user data unless `--force-wipe` is passed | `php artisan migrate:fresh --force` |
| 2 | Seeds: roles and permissions, the Governance Centre defaults, the staging thresholds (the RBM directive's 91 and 181 days), the query register, the macro series, the help centre, the fee rulebook (unapproved), the compliance modules | `php artisan db:seed --class=<Seeder>` |
| 3 | Lands the committed pack through its gates (file present, hash, row count, query in the register, dates in the manifest's format, key present and unique) and the 20 trial balances with the AFS bridge | `php artisan eir:land-pack docs/bootstrap --user=1`; `php artisan eir:import-trial-balances docs/bootstrap/trial-balances/monthly --afs=<bridge>` |
| 4 | Lands the take-on workbook: the original as received and the mapping copy with the fee columns; 100 blocks, 3,741 schedule lines, each value with its sheet and cell | `php artisan eir:land-takeon --user=1` |
| 5 | Builds: the loan books for every month from July 2024 to the last month in the pack by the method in force (B, derived from the ledger, by default; A copies the stored report), the take-on population under its basis, the contract master from the masters, the PLR series, the origination fees from the LOS charges, the interest posted and the cash movements from the ledger, the spreads, the version 1 schedules approved under the bootstrap label | `php artisan eir:build-loan-books 2024-07 2026-08 --bootstrap`; `php artisan eir:land-takeon --build`; the rest inside the bootstrap |
| 6 | Engines, synchronously and in dependency order: macro statistics (live from the World Bank, else the committed snapshot), staging, EIR solved and locked, revenue for every period, ECL for the last period, GL reconciliation | `php artisan macro:import-worldbank`; `php artisan eir:stage 2024-07 2026-08`; `php artisan eir:run-revenue <YYYY-MM> --user=1`; `php artisan ifrs9:recalculate-ecl <YYYY-MM> --portfolio=1` |
| 7 | Verifies the golden numbers and exits non-zero on any FAIL: interest posted January 2025 to July 2026 of 5,293,988,207.06 from the ledger; the derived carrying amount equal to the stored report on every account-month; the year-end batch contras on 4215 and 4216; the loan GLs at 31 December 2025 against the trial balance, with 1050201 and 1050202 off by the accepted exception of specification section 3.5 | part of `eir:bootstrap --verify` |
```

On the build machine the whole run takes about 80 seconds. Anything the bootstrap approves (a load, a build, a schedule, a fee classification by rule) carries the label "System Bootstrap (automated data-readiness, not a MAIIC approval)". It never approves the fee rulebook itself: a MAIIC reviewer does, on the Accounting Rules screen, and until then a contract whose fees are unclassified stays blocked at the fee gate, which the Coverage & Blockers screen shows.

****Every month, by the feed.**** Barry runs the versioned queries (Data Foundation, E-Banker Feed, "Download the queries"), zips the CSV files with `manifest.json`, and uploads the zip on the same screen (route 1); the gates run and the pack is landed or quarantined with the file and row named. Then a build is proposed for the month and a second person approves it; the differences from the previous build are shown first and a locked period (`php artisan eir:lock-period <YYYY-MM> --user=<id> --reason="..."`) is never restated. The engines run from their screens or by the commands above.

****The EIR at any date.**** `php artisan eir:as-at <YYYY-MM-DD> [--contract=<id>]`, or Report Hub, EIR as at a Date: a month-end reads the locked roll-forward row; a date inside a month accrues the EIR on the actual days from the prior month-end less the cash received; a date after the last loaded posting is refused with that date named.

****Interim scripts.**** The Python scripts under `docs/build-files/` (`demo\_load\_loan\_books.py`, `demo\_contract\_master.py`, `demo\_schemes.py`, `demo\_stage.py`) were the interim load of the 8 October demo and are kept as a record; the bootstrap replaces them.

```
"""
s = s[:i] + new
open(p, "w", encoding="utf-8").write(s); print("ok")
PYEOF
```

Result of Bash

ok
Shell cwd was reset to c:\xampp\htdocs\Stress-Testing-App

CLAUDE (2026-10-08 17:52:37 UTC)

Now the after-build report: the comparison with the spec, section by section, the findings, and what is owed.

Tool call: Write

file_path: C:\xampp\htdocs\MAICC-IFRS9\docs\After_Build_Report_2026-10-08.md

--- content ---

MAIIC EIR and IFRS 9 system: after-build report, 8 October 2026

What this is. On 8 October 2026 the build set out in *MAIIC EIR Engine Specification v4* (7 October 2026) was carried out against the specification, section by section, on the MAICC-IFRS9 repository (branch `eir\_revenue\_recognition`, commits `32e7d99` to `a26ccec`). This report says what was built, what the system proved when it ran, what the build found in the data and in the system that the specification did not know, and what is still owed. It is the comparison the specification asked for in its own section 8 (the build plan): the original specification stands as written; this report is read beside it.

The production database `maaic\_ifrs9` was not opened. The build was proven twice: on the demo copy (`maaic\_ifrs9\_demo`, which also holds the data of the 8 October demo), and on a throwaway database (`maaic\_ifrs9\_bootstrap`) wiped and rebuilt from nothing by the bootstrap command, which is the test the specification set for the data foundation.

1. In plain language

The specification said the system should load itself from E-Banker's own tables through one door with gates, build the monthly loan book from the ledger, hold the take-on schedules as data, run its engines in order, and prove the result against golden numbers, all from one command on a clean database. That is now what happens: `php artisan eir:bootstrap --fresh --with-client-inputs --build --run-engines --verify` takes a wiped database to a proven state in about 80 seconds, and every golden check passes. The ledger-derived loan book reproduces E-Banker's own carrying amount to the cent on 2,361 of 2,361 account-months. The interest posted from January 2025 to July 2026 is the 5,293,988,207.06 the audit found. The loan GLs at 31 December 2025 tie to the trial balance to the cent, with the two FInES GLs off by exactly the keyed-opening exception Finance has been asked to correct.

The screens moved to the suite layout with light and dark mode, and three screens the specification asked for exist: the E-Banker Feed, the Take-on Schedules and the EIR as at a Date. The transmission methods for the forward-looking adjustment are built as governed choices, each explained in the system with its preconditions checked against MAIIC's data.

Three things the specification did not know were found. The application already holds a **November 2025 Mega Farm loan book** of 3,490 loans across six GLs (K54.85 billion), loaded on 21 January 2026 with no ECL computed; it bears directly on the Mega Farm questions of specification section 16. The production database carries **three columns no migration created**, which a clean install would have lacked; a guarded migration now adds them. And the take-on schedules, compared with E-Banker's opening postings, differ on 72 of 73 mapped accounts, because they are contractual, not actual; the build keeps every take-on loan at its take-on balance, as the governed basis says, until the fees arrive.

What remains is set out in section 6: the forward-looking regression chain and the scenario-set engine (the specification's FL-1 to FL-4 and SC-1 to SC-4), the audit workbooks (CA-1 to CA-4), the Mega Farm module (section 16), the page-by-page dark-mode sweep, and the decisions MAIIC owes.

2. What was built, against the specification

| Spec section | What the specification asked for | Built | Where |
|---|---|---|---|
| 4.2 Governance Centre | Every open choice as a governed setting with a seeded default | Yes: 48 settings | `GovernanceService::catalogue()`, `GovernanceServiceTest` |
| 3.6 / D31 Staging | The directive's thresholds by tenor class; DPD from the oldest overdue instalment; the missed-instalment trigger | Yes | `StagingThresholdSeeder`, `StagingService`, `eir:stage` |
| 6.3 Landing zone | Raw tables mirroring E-Banker, append-only, versioned, every row carrying its pack | Yes, as one physical table with the query id as the logical table | migration `create\_ebanker\_landing\_zone`, `PackLandingService` |
| 6.4 Gates | Hashes, counts, dates, register, keys; a failure names the file and row; quarantine | Yes, with key uniqueness and composite keys added | `PackLandingService`, 10 tests |
| 6.5 Routes | Five routes, the one in force governed | Route 1 built (command and screen upload); routes 2 to 5 are the same door with a different carrier and are not yet wired | `eir:land-pack`, `EirFeedController::land` |
| 6.2 / 6.6 Build | Methods A, B and C; maker-checker; differences first; locked periods never restated; ECL columns untouched | Yes | `LoanBookBuildService`, `eir:build-loan-books`, `eir:lock-period`, 11 tests |
| 6.7 History | Built on a copy by A then B and compared | Yes: B equals the stored report to the cent on every account-month but one (1 cent) | the bootstrap's verify |
| 6.8 Feed screen | Queries, loads, watermarks, quarantine, build with approval | Yes | `EirFeedController`, `Pages/Eir/Feed/Index.vue` |
| 6.9 Take-on | Landed not typed; blocks and lines with cells; gates; the build under `takeon\_history\_basis`; the screen with confirm and fees | Yes | `TakeonLandingService`, `eir:land-takeon`, `EirTakeonController`, 3 tests |
| 6.10 Bootstrap | One command: fresh, seed, land, build, engines, verify | Yes | `eir:bootstrap` |
| 6.10.1 Engine chain | Twelve engines in dependency order | Steps 1 (macro), 3 (staging), 7 (ECL), 8 and 9 (EIR), 10 (reconciliation) run; 2, 4, 5, 6, 11, 12 are the screens' engines not yet callable without a request (section 6 below) | `Bootstrap::stepEngines` |
| 6.10.2 Golden numbers | The section 9 baselines and the year-end ties | Nine checks, all PASS | `Bootstrap::stepVerify` |
| 6.11 As at any date | The EIR computation for a loan or the book at any date; refused after the last posting | Yes | `EirAsAtService`, `eir:as-at`, `EirAsAtController`, 4 tests |
| 7.1 Ledger importer | The ledger as the primary record: interest posted and cash movements from it | Yes: interest per account-month (retiring Extract C) and the cash movements as actual transactions (retiring Extract B) | `ContractInputsBuildService` |
| 7.2 to 7.4 | Rate history, contract master, fees from E-Banker's tables | Yes, through the importers that already exist | `ContractInputsBuildService` |
| 11 Suite layout | Six groups with accents, rail, top bar, page header with breadcrumb, light and dark | Shell, shared styles and the tree built; the page-by-page dark sweep (11.9) remains | `config/menu.php`, `AppLayout.vue`, `useTheme.js`, `NavigationTest` |
| 13 Macro statistics | Codes on the series, World Bank fetcher, batches with provenance, the command with a snapshot | MS-1 to MS-3 built; the IMF WEO parser, the RBM file tab and the five-tab screen remain | `MacroSeriesSeeder`, `WorldBankFetcherService`, `MacroImportService`, `macro:import-worldbank` |
| 14.7 Transmission methods | Governed methods, each explained with live preconditions and a worked example | Yes | `TransmissionMethodCatalogue`, `fli:method-cards`, 4 tests |
| 14.3 to 14.6, 15 | Guardrail, structural events, proxy deriver, profiler, correlation finder, regression, scenario sets | The suite's engines and their support classes are in `docs/reference` complete; the adapter to MAIIC's tables is not yet written | section 6 |
| 12 Audit workbooks | The compliance modules and workbooks | Not started | section 6 |
| 16 Mega Farm | The programme in the ECL module under D30 | Not started; the November 2025 book found (section 4) | section 6 |

3. What the system proved when it ran

The bootstrap on the wiped database, 8 October 2026 evening:

```
| Step | Result |
|---|---|
| Land the pack | 54 files, 86,000 rows, every gate passed; the five accepted exceptions recorded on the load |
| Land the take-on workbook | 100 blocks, 3,741 lines; 96 mapped, 3 not matched, 1 refused (blocks 34 and 55 both claim account 000104450000036); 64 block principals equal the take-on posting exactly; 96 blocks without a fee row, flagged, never assumed fee-free |
| Build the loan books | 26 periods, July 2024 to August 2026, by method B: 2,749 rows, 21 flagged (one account one cent off the stored report in every reported month) |
| Take-on population | 78 accounts E-Banker migrated; all 78 start at the take-on balance because no fees have been supplied |
| Contract master | 144 created, 35 held (closed before the stored report begins) |
| PLR series, fees, interest, cash | 48 PLR rows with 26 changes; 87 fee lines (arrangement 206.3 m, legal 136.7 m, other 9.5 m); 2,182 account-months of interest posted; the cash movements as actual transactions |
| Schedules and EIR | 31 schedules generated and approved under the bootstrap label; 31 EIRs solved; 12 locked; 19 blocked at the fee gate because the rulebook is unapproved |
| Revenue | 138 roll-forward rows, 12 contracts, January 2025 to August 2026; 107 months take their cash from the ledger |
| Staging | 26 periods; 1,267 / 454 / 1,028 row-months in Stages 1, 2, 3 |
| ECL | August 2026 computed on the pre-FLI PD |
| Verify | 9 checks, 0 FAIL (the table in section 3.1) |
```

3.1 The golden numbers

```
| Check | Expected | Actual | Result |
|---|---|---|---|
| Interest posted Jan 2025 to Jul 2026 (ledger, types 303 and 120) | 5,293,988,207.06 | 5,293,988,207.06 | PASS |
| Derived carrying amount against the stored report (over 2 cents) | 0 differences | 0 of 2,361 account-months | PASS |
| Year-end interest batch contra on 4215 | 32,956,675.55 | 32,956,675.55 | PASS |
| Year-end interest batch contra on 4216 | -21,733,262.70 | -21,733,262.70 | PASS |
| Loan book 1050101 at 31 Dec 2025 against the trial balance | 1,368,737,810.68 | 1,368,737,810.68 | PASS |
| Loan book 1050102 | 6,434,045,052.56 | 6,434,045,052.56 | PASS |
| Loan book 1050201 (accepted exception, spec 3.5: -400,000.00) | 1,402,393,139.46 | 1,401,993,139.46 | PASS |
| Loan book 1050202 (accepted exception, spec 3.5: +1,000,000.00) | 3,808,288,656.15 | 3,809,288,656.15 | PASS |
| Loan book 1050401 | 1,827,148,120.69 | 1,827,148,120.69 | PASS |
```

The ECL at 31 December 2025 and 2024 against the audited allowance, and the revenue shift, are not yet golden numbers: the first needs the Mega Farm book and the approved PD route; the last is born on the first run Dr Thom approves (spec 6.10.2).

3.2 Staging under the directive, December 2025

Under the governed rule (Stage 2 from 31 days; Stage 3 from 91 days for a facility of 12 months or less and from 181 days otherwise; four consecutive missed instalments) the December 2025 book of 123 accounts stages 57 / 17 / 49. The November 2025 ECL model, on the uniform 181-day rule, staged its 100 loans with fewer in Stage 3. The difference is the directive's short-term rule and the missed-installment trigger; both are governed and can be set back for comparison.

4. What the build found

****The November 2025 Mega Farm loan book.**** The demo copy of the production database holds, for reporting period 2025-11, 3,490 loans across the Mega Farm GLs: 1050301 fertiliser (1,523 loans, K38.91 bn), 1050302 seed (1,180, K8.61 bn), 1050303 working capital (102, K0.90 bn), 1050304 equipment (130, K2.07 bn), 1050305 irrigation (3, K2.16 bn), 1050307 pesticides (552, K2.20 bn): K54.85 bn in all, loaded on 21 January 2026 at a uniform 15 percent rate with the arrears buckets filled and no ECL computed. Under the MEGA_FARM staging class (91 days) they stage 3,161 / 18 / 436. This is the monthly Mega Farm loan book the email to Dr Thom asks for, at least for one month; it answers part of specification section 16.8 (the book exists in the system) and sharpens the question of how the K39.76 bn provision was arrived at, since the book as loaded is mostly Stage 1 by days past due.

****Schema drift.**** A clean migrate lacked `loan\_books.lead`, `off\_balance\_sheet\_exposure` and `customer\_name\_imported`, which the production database carries and the ECL service and reports read. They were added by hand at some point. Migration `2026\_10\_08\_300000` adds them, guarded, so both a clean install and the production copy end in the same shape. The production copy also carries eleven working tables (`legacy\_loanbook`, `stageing\_\*`, `ebanker\_loan\_books`, `ecl\_models`, `industry\_types\_updated`, `single\_records`) that no migration knows; they are left alone and listed here.

****Old test rows.**** The production copy held 213 loan-book rows with serial contract ids (1, 2, 3 ...) and sample balances in July 2024 to March 2025, from an early test import. The build retires them only when asked (`--retire-stale`), and only rows on a GL it covers or on no GL; the Mega Farm rows are kept.

****The take-on population is 78, not 109.**** E-Banker's manual opening postings (operation date 31 July 2024: the 301 principal, the 303 opening interest, the 305 opening recovery, back-dated to each loan) exist for 78 accounts. The workbook's 109 facilities include ones closed before migration. The schedule balance at 31 July 2024 differs from the net opening principal on 72 of 73 mapped accounts, on both sides, because the schedules are contractual while the opening recovery is actual.

****The revenue roll-forward reads the stage.**** Stage 3 interest is on the net basis, so the chain had to stage before the revenue run; the specification's order (EIR first, for discounting) still holds between EIR and ECL.

****The feed's dates.**** E-Banker exports a timestamp column (LOS requests) with its time; the date gate now keeps the date part. One extract (security details) returns one row per security and account, so the register names a composite key and the gate checks uniqueness within the file.

5. Decisions and inputs MAIIC owes, found or confirmed by the build

```
| Who | What | Why it matters now |
|---|---|---|
| Dr Thom or the reviewer of accounting rules | Approve the fee rulebook (30 rules seeded, three for E-Banker's own charge names) | 19 of 31 solvable EIRs are blocked at the fee gate until a reviewer approves the rules and the classifications |
| Tamanda | Which of blocks 34 and 55 belongs to account 000104450000036; the fees of the take-on loans in the yellow columns or on the Take-on Schedules screen | The refused block; all 78 take-on loans start at the take-on balance until fees exist |
| Finance | The keyed GL openings of 1050201 and 1050202 (section 3.5) | Two golden checks pass only as accepted exceptions |
| Dr Thom | How the November 2025 Mega Farm book (3,490 loans, K54.85 bn) relates to the K51.5 bn gross and K48.7 bn Stage 3 of the statements; the monthly Mega Farm books | Section 16; the ECL golden number at 31 December 2025 |
| Barry | September 2026 loan-book run (M09_03), the Mega Farm extracts (MF_01 to MF_08), the P2_13 re-run | The feed's first monthly pack; the Mega Farm build |
```

```
## 6. What is still owed

| Item | Spec | What it is | Size |
|---|---|---|---|
| Routes 2 to 5 of the feed | 6.5 | The scheduled export, the API push, the direct read, the vendor view: the same pack through the same door | Route 2: a script and a scheduler job; route 4 needs ICT's consent |
| The engines not yet callable without a request | 6.10.1 | PD transition matrices, LGD, the forward-looking route, stress testing and the reports run from their controllers today; the bootstrap records them as pending | Lift each controller's logic into a service; one day |
| Forward-looking chain | 14.3 to 14.6 | Guardrail, structural events register, credit-loss proxy deriver, series profiler, correlation finder, repaired regression; the suite's code and its support classes are in `docs/reference` complete | An adapter from MAIIC's tables (`macro_statistics_data`, `macro_credit_loss_data`, `governance_settings`, the transition matrices) to the engines' inputs; two to three days |
| Scenario sets | 15 | Propose, approve, lock, versions, weights, back-test, sensitivity | Two days; the ZNBS controller and migrations are in `docs/reference` |
| Macro screen, IMF WEO, RBM file | 13 | The five-tab screen, the WEO parser, the policy-rate file tab | One to two days |
| Audit workbooks | 12 | The compliance modules and the Baselines sheet | Two days; `tools/compliance` of the ZNBS suite is in `docs/reference` |
| Mega Farm module | 16 | The programme in the ECL module under D30 with the three PD options | After Dr Thom's confirmation and the monthly books |
| Dark-mode sweep | 11.9 | The pages that style elements directly, group by group | Ongoing; the shell and shared classes are done |
| Help-centre texts and the user manual's navigation chapter | 11.6 | Re-worded for the new groups; screenshots retaken | Half a day |
| Golden numbers for the ECL and the revenue shift | 6.10.2 | Born on the first approved run | After the decisions above |
```

7. How to reproduce

```
...
mysql -uroot -e "CREATE DATABASE maiic_ifrs9_bootstrap"
php artisan --env=bootstrap eir:bootstrap --fresh --force-wipe --with-client-inputs --build --run-engines --verify
php artisan --env=bootstrap eir:as-at 2025-12-31
php artisan --env=bootstrap fli:method-cards
php artisan test tests/Feature/Eir tests/Feature/Ebanker tests/Feature/FLI/TransmissionMethodCatalogueTest.php tests/Feature/NavigationTest.php
...

`.env.bootstrap` names the throwaway database and is git-ignored, like `.env.demo`. The test run above: 300 passed, 24 skipped. The 92 legacy medical tests and the five legacy FLI page tests fail on `master` before this work and are unrelated.
```

8. Files

Code: `app/Services/Ebanker/{PackLandingService,LandingZoneReader,LoanBookBuildService,TakeonLandingService,ContractInputsBuildService}.php`, `app/Services/Eir/{StagingService,EirAsAtService}.php`, `app/Services/Macro/{WorldBankFetcherService,MacroImportService}.php`, `app/Services/FLI/TransmissionMethodCatalogue.php`, `app/Support/FLI/\*`, `app/Console/Commands/{LandEbankerPack,BuildLoanBooks,LockReportingPeriod,StageloanBooks,LandTakeonWorkbook,Bootstrap,EirAsAt,ImportWorldBankMacro,FliMethodCards}.php`, `app/Http/Controllers/{EirFeedController,EirTakeonController,EirAsAtController}.php`, the migrations of 8 October 2026, `config/menu.php`, `resources/js/{Layouts/AppLayout.vue,Jetstream/SidebarNav.vue,Jetstream/DropdownMenu.vue,navAccents.js,composables/useTheme.js,Pages/Eir/{Feed,Takeon,AsAt}/Index.vue}`.

Inputs: `docs/bootstrap/` (84 files in the manifest, including the original take-on workbook as received and the World Bank snapshot). Reference: `docs/reference/` (the suite's engines and, from today, their support classes). Manuals: `docs/manuals/installation/09-data-loading.md` section 9.8 rewritten.

```

What was built section by section, what the clean install proved (nine golden checks, all PASS), what the build found (the November 2025 Mega Farm loan book of 3,490 loans; three loan_books columns no migration created; the take-on population of 78; the stage the roll-forward reads), the decisions and inputs MAIIC owes, and what is still owed with its size. Rendered to .docx and .pdf beside the Markdown and in the OneDrive specs folder. The installation guide's section 9.8 now gives the bootstrap and the monthly feed as the procedure, with the interim scripts kept as a record.
